Above all, we dedicate this ebook to Mother Nature (Gaia), and all children and future generations of all creatures to come.

Bill Mollison, "The Father of Permaculture," and friends

Foreword

by Dr. Douglas Graham

The year 1967, "The Summer of Love," was a time of relative innocence; a rebellion against the establishment (the Vietnam War was really heating up) by back-to-the-land "hippies," or "flower children," and fantastic change (fans were blown away by the first season of Star Trek in '66-67, and the technological possibilities it foreshadowed). In '69, the acclaimed singer/songwriter Joni Mitchell captured the generation when she wrote and performed the classic and often quoted song, *Woodstock*. In *Fruiticulture,* David appropriately used this quote from the song, and I agree fully: "And we've got to get ourselves back to the garden."

Certainly that phrase caught my attention, and that of countless other young men and women at the time, as we were in our formative years and we looked to the musicians for guidance on politics, philosophy, and even religion. More than one hundred different musicians wrote songs against our involvement in the Vietnam War, but Joni's *Woodstock* may have been the most influential.

Grace Slick ranted against the poisoning of our Earth as she and The Jefferson Airplane co-led the counterculture revolution. In the song, *Eat Starch Mom*, she quipped, tongue in cheek, "I don't care if there's chemicals it in, as long as my lettuce is crisp"; a sad but all too true commentary on the apathetic mainstream view towards health and the chemical poisoning of our planet.

As John Lennon and The Beatles came of age, they stopped writing catchy but meaningless ditties and began expressing their views on life, politics, and yes, the revolution. In their song, *Revolution*, The Beatles acknowledged that "we all want to change the world," but made it clear that they will not support "destruction" or "people with minds that hate."

Even Peter Townsend and The Who, authors of the song, *My Generation*, couldn't resist the temptation to write about their frustration in trying to create the changes that they

could see were necessary if society was to go in a healthy direction. The lyrics to their song, *Magic Bus*, profoundly express what it is like to be a young person being squashed by an older generation that wields all the power and all the authority. Youth: "I want it, I want it, I want it, I want it," Authority: "You CAN'T have it."

As a youth and then a teen, David Klein was immersed in all of these influences. He also withstood a continual nonstop bombardment of brainwashing from the mainstream medical establishment that told him there was "no cure" for his ulcerative colitis. From ages 18 to 26, ulcerative colitis destroyed his health and made his life miserable. He was told that diet was not a factor in his disease (he ate the standard American diet), and he must conform and take medicines, even though the medicines did not in any way help him heal. One medicine even gave him temporary brain damage.

Through it all, David never surrendered his passion to reclaim his health. His search led him to the Fruitarian Diet, and thirty-four years later he is still crowing about how it resurrected his life, and then some. In *Fruiticulture,* David, along with his great ecologist friend Don Weaver, brings their shared dream to light—they literally pour their hearts out in revealing their vision of global health. Their message was never more necessary.

Over the past twenty-five years, David has persistently and consistently focused on helping others regain their health, guiding them on issues of diet and lifestyle, while Don has taught the world the value of planting fruit trees, growing organically, and remineralizing the world's soils to bring us the truly nutritious food we are lacking. In *Fruiticulture*, David and Don take their teachings another step deeper, addressing the heart of the matter. David and Don teach us how to create a culture of fruit, the world's best food, and the best agricultural crop for the environment.

Four Fruitarians
Left to right: Morris Krok, Enrique Candioti,
Don Weaver, Dr. Douglas Graham

In Section 1, David explains the science that identifies our need for fruit, tells us what will happen if we don't eat enough fruit, and then describes exactly how to guarantee that our fruit intake is sufficient.

In Section II, David and Don identify the substances, influences, conditions, and forces necessary for growing the highest quality fruit from the healthiest trees, and they explain why fruitarianism and fruit-based agriculture can restore the world to vibrant health.

In Section III, David takes on big issues, such as how to end world hunger, pollution and wars.

True to the slogan of "Think globally but act locally," Section IV explains what we can do as individuals to join, and lead, the Fruiticulture revolution.

David and Don are co-leading a health revival for humanity and the planet, and I am fully on board. Together with our Fruitarian health educator friends we have put on numerous Fruitarian health education events and contributed to each other's literary works for more than twenty years.

These days, our athletes may have even more influence than the musicians. I had the good fortune of being Martina Navratilova's nutrition coach at the time when she ate the first banana ever consumed live on television on court at a major tournament. That summer, thousands of recreational level tennis players mimicked her actions. The banana has remained an on-court staple ever since; an important step of acceptance for a fruit that was considered uncouth to eat out of hand a mere 100 years ago.

When Michael Jordan crashed into our consciousness, an entire generation wanted to "Be like Mike," unthinkingly eating and drinking whatever he promoted, none of which was healthy. "Sir" Charles Barkley didn't want to be held responsible for the effect his self-destructive lifestyle was having on his viewers. His famous quote, "I'm no role model," was an ineffective attempt at a disclaimer. Our good friend and my former student, Bradley Saul, responded by creating OrganicAthlete; a nonprofit organization dedicated to helping people to live more healthfully, while also encouraging athletes to take a more responsible role when choosing their sponsors.

Today, vegan athletes are no longer uncommon, and you will find them disproportionately represented in the top ten percent of almost every sport. For the 2018-19 season, the NBA welcomes to the league its first raw vegan athlete in superstar Michael Porter Jr., a client of mine whose diet consists primarily of fruit, and is rounded out by raw vegetables, nuts, and seeds. The next wave of youngsters will be eating fruit when they choose to be like this Mike.

David's idea for writing *Fruiticulture* with Don is a grand slam homer, as it brings us all back to our naturally healthful ways of eating sweet and juicy fruit, to living in peace and harmony with Nature, to the nurturing embrace of Hygiea, the goddess of health—enabling us to live long and healthy lives by giving humanity and our planet the nurturing care it truly needs. I think *Fruiticulture* is the most important "planetary healers manual" since Viktoras Kulvinskas's seminal *Survival Into the 21st Century* book of 1975, and sharing *Fruiticulture* may be the single most important thing you ever do for your loved ones.

Introduction

by David Klein, Ph.D., Jesse Krebs, Ph.D. & Don Weaver

Let's Get Back to Nature – Now!

by David Klein, Ph.D.

Our global crises can only be attributed to humanity's disconnection from Nature. We've cut ourselves off from our natural biological roots and lost touch with our true instinctual selves. Trapped in unnatural lifestyles, most have lost touch with their sense of appreciation, empathy, communal spirit and ability to reason. Worst of all, most people eat toxic pseudo-foods, accept toxemia, defile the environment, attempt to remedy disease with chemicals, pardon pollution, forsake compassion, condone killing and ignore Nature's munificent providence. And now our planet and too many of us are sick, suffering and in turmoil, hoping our governments and unnatural technologies will bail us out.

The most aberrant and destructive human imprudence of all is not eating our natural biological diet: the Fruitarian Diet. This mistake is the prime cause of:

- unhealthy minds and bodies
- worldwide disharmony and turmoil
- disrespect for life, killing and wars
- neurological and endocrine biochemical imbalances (mental and emotional)
- inability to reason and solve problems for the good of society and the planet
- addiction to and dependence upon unnatural, toxic and unsustainable industries and technologies for our basic needs
- extravagant cancer and other killer disease rates

- exorbitant human overpopulation
- perilous environmental/ecological degradation
- cataclysmic animal extinctions
- birth defects
- rising infertility
- great planetary suffering

Now here's the good news!

By making a change to the Fruitarian Diet Lifestyle and Fruiticulture, the degradation of our genes, inability to reproduce, deformities, stunted intelligence potential, sociological delinquencies and turmoil, moral and ethical erosion, extravagant disease incidences, increasing overpopulation, environmental degradation and destruction of our planet will be reversed.

To be healthy in mind, body and spirit, each of us must be more vigilant than ever in bringing Nature back into our lives on a daily basis, and connecting with our Fruitarian instincts. Nature is beckoning! Wholeness will only be restored when we reconnect with our natural instincts and follow Natural Law, living healthfully and cooperatively/symbiotically as one human race and community of life.

That means embracing the spirit of giving: appreciation, help, restoration, fruit sustenance, and love—every day, at every turn, for the good of all. This also means disconnecting from toxic technologies, sacrificing no animal for food and sanctioning no wars. Embracing Fruitarianism and Fruiticulture begets vibrant health, contentedness and deep reverence for the gifts of Nature. It puts an end to 99 percent of medical procedures and the 99 percent of the pharmaceutical industry's drugs, and sets humanity on the path of sustainable health for planet Earth and all her inhabitants.

Permaculture Defined

Permaculture is a conscientious, civilized, way of living in harmony with Nature—a culture of living integrously, reverentially, synergistically, wholistically, healthfully, and sustainably, employing biomimicry and diverse organic horticulture, and complementary "green" design and regenerative practices.

Fruit Defined

That part of a seed package developed and grown specifically by a plant (stalk, vine or tree) to induce consumption by its biological symbionts, begetting the incidental benefit of the spreading of its seed. Fruit is the only form of plant life grown specifically as food for symbiotic beings.

Fruiticulture Defined

Fruiticulture is simply Permaculture with a focus on fruit (or "fruit-centric") agriculture, or agroforestry, and local and global communities and economies based on fruit growing and eating.

Frugivore Defined

A frugivore is an animal or being whose biological, physiological and anatomical design, constitution, and natural instincts indicate that a fruit-based diet is its natural and, therefore, most healthful diet.

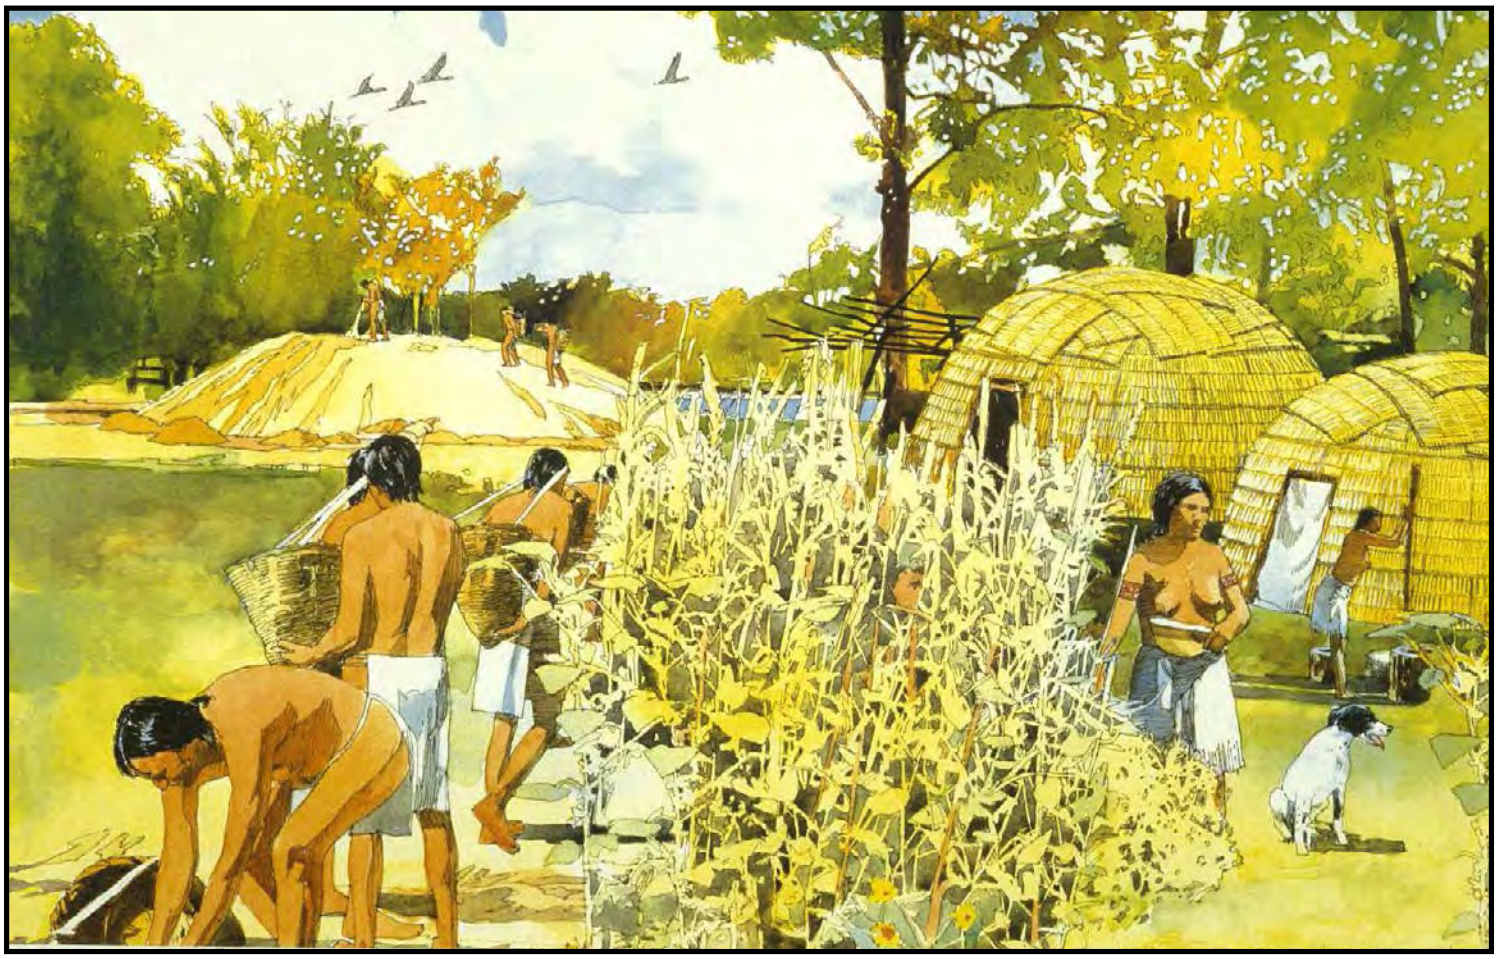

Fruitarian Defined

A fruitarian is a human who eats his/her natural biological diet of primarily raw fruits and, secondarily, raw vegetables, plus minimal-to-moderate amounts of raw seeds and nuts.

A Look at History

Throughout the ages, the healthiest and most successful people have been those living in harmony with Nature. The history of the Essenes, Hunzakuts, Vilcabambans and various aboriginal tribes provide us with significant lessons that we can use to our benefit. Consider that before the Europeans descended upon North America 500 years ago, this was a glorious, pristine continent with abundance for all its inhabitants, who coexisted nearly perfectly with the land and its natural gifts. There was no waste, no pollution, no excessive carnage, minimal interference with the balance of Nature and no unnatural human population overgrowth. Of course, we "civilized," technology-obsessed humans have changed all of that and we must now reverse the tide, returning to our innate natural ways, getting ourselves "back to the garden," as Joni Mitchell put it.

The world view of indigenous North American people included a collective responsibility for stewarding the land and taking from it only the essentials for sustenance and shelter. With a spiritual awareness of the interconnectedness and interdependence of all life forms on the Earth, they lived by a credo of sustainability for many generations. The Great Law of the Haudenosaunee, for example, states that "in our every deliberation we must consider the impact

A depiction of how the Haudenosaunee lived in what is now New York state

of our decisions on the next seven generations." They sustained themselves well by anchoring their diet with the "Three Sisters": squash, beans and corn, plus berries and nuts—each of which, except for nuts, is botanically classified as a fruit.

The theme of the wonderful book *Original Instructions – Indigenous Teachings for a Sustainable Future*, edited by Melissa K. Nelson (2008), is remembrance of the "original instructions" handed down to and taught by indigenous people of our lands—that is, how to live on Earth "in a good way, in a way that lasts." This way is a sacred journey marked by peace and harmony for seven generations and more to come. Via a spiritually-aware attitude of gratitude and conscious giving back to Mother Earth, a respectful kinship with all life is cultivated, facilitating civilizations living in intimate harmony with their local environments, maintaining wholeness and abundance.

In accordance with a common ancient legend, Native Americans revere their continent as "Turtle Island." As the story goes, a very large tortoise volunteered its shell as a home for the land animals; North America is perched on its back. As such, their "island" home deserves to be

treated with honor and respect, since, if it was tipped over, everyone would drown. It seems we have tipped our "island" and are treading water. Today's aboriginal elders pray that we wake up, join the original "sacred circle" and return to Turtle Island, restoring peace, health and prosperity for all.

The ancient Essenes' lovely doctrine of "Sevenfold Peace" can help us get there. It is about spiritualizing our lives by practicing peace of body, mind, heart, family, community, creative work, ecology and, ultimately, all of physical and spiritual reality. This a good way for all of us to "be" every day.

The Promise of Fruiticulture

As you will glean from this book, the Fruitarian Diet and Fruiticulture are not only a delicious way to eat and a better form of agriculture, but they are the keys to every personal and planetary transformation we desire, and they can optimally nourish all of humanity. We'll explain how and why this is possible, and how the Fruitarian Diet literally saved my life and at least greatly enhanced the lives of most of the other contributors, as well as a million or so of others who've gone Fruitarian. After assimilating this entire book, I'd love to get your response to all of this!

A Fruiticulture food forest, Maui, Hawaii

Veganic Fruiticulture is the Fruitful Way

by Jesse Krebs, Ph.D.

Veganic Fruiticulture is an approach to growing food that encompasses a respect for animals, the environment and human health. It is a form of agriculture that goes above and beyond the standards for organic farming by excluding the use of products derived from confined animals and by encouraging the presence of native wild animals on the farmland. Organic farmers are permitted to use animal products as fertilizers: manure, blood meal, bone meal, feather meal, and fish emulsion.

Veganic Fruiticulture breaks the link between livestock operations for the production of organic plant-foods by using plant-based techniques for soil fertility such as: glacial rock dust, mulching, fruit and vegetable compost, green manure, wood chips, crop rotation, polyculture and other sustainable methods. A veganic maxim states that by feeding the soil, the soil will feed the plants and trees. Adding organic plant-based materials to the soil produces a rich, living soil that has a plethora of microorganisms, which in turn feed the plants and create long-term sustainable fertility.

Veganic Fruiticulture is the ultimate ideal for a sustainable, vibrantly thriving culture. There simply is no better way of living in harmony with Mother Nature and being true to our frugivorous nature than to create cruelty-free, abundant fruit forests in every open space available. Who needs a grass lawn anyway? Can you imagine a society where you can walk and freely pick your lunch from the trees that line the streets and fill the public parks and places? Fruit trees create fertility, abundance, and health.

We have a naturally symbiotic relationship with fruit trees. They tempt us with their sweet, tangy edibles so that we, in return, will spread their seeds to sustain their species. No life is lost in Veganic Fruiticulture—there is only a perpetuation of fertility, life,

health and abundance. That is a life in harmony with nature—the foundational design element for all human systems, integrated harmoniously with the planet's ecology. That is Veganic Fruiticulture!

Understanding & Meeting Our True Human & Planetary Needs

by Don Weaver

My primary passion is for "the causes of health" and seeing humanity awaken to these causes and go beyond misguided preoccupation with disease, destruction and death. It is time to transform our relationship to ourselves, Nature and the Earth by understanding and meeting true human and planetary needs. Clearly, such understanding and sufficient "applied love" can swiftly restore and regenerate our now largely degenerate species on our interdependently degraded and depleted Earth Biosphere. This total Earth Regeneration requires that we free ourselves from the psychic and physical addictions of our false little fear-driven egos which futilely attempt to fill the voids meant to be filled to overflowing with the natural expressions of human love, wisdom, goodness and compassionate action. These expressions are generally smothered by the false beliefs and miseducational systems designed to produce competitive, conforming consumers who passively accept the health-and-earth-destructive mass media images of "how to live in the modern world."

If our passion is for knowing how to live sanely, healthfully and constructively in symbiotic (not parasitic) relationship with each other and our home planet, then we will discover, and remember, those wise ways. Will they include living lightly, planting gardens and orchards, giving back compost and rock dust to the soil which gave us our body, embracing living nutrition and health? Surely it's our degree of passion-compassion-love of life and gratitude for Life which energizes us to muddle or fly toward realization of truthful answers. As more and more of us rise up on our human/angel wings, the total world consciousness will rise up with us.

Possibly the hypnotic spell imprisoning much of natural human consciousness can be broken as enough of us live a life demonstrating healthy love between people, animals, plants, trees and all Creation. Perhaps the wise, responsible and compassionate thing to do is for each of us to assume it is our passion that will determine the fate of humanity

and Earth. Each may say: "If I am Life then I must pass-Life-on to this and future generations." This is another way to feel the truth of "pass-i-on." Life is our birthright; it is definitely our adult opportunity!

"When the truth is buried deep
Beneath a thousand years of sleep
Time demands a turn around
And once again the truth is found"
-George Harrison (a verse given to Donovan for his classic song, Hurdy Gurdy Man)

Fruit tree planting in India by Naandi Foundation

Generosity Towards the Earth Can Swiftly Reverse Our Soil-Food-Health Degeneration

by Don Weaver

An unknown author—perhaps it was "the human soul"—proposed that: "Unhappiness is the hunger to get. Happiness is the hunger to give." I think we can see a lot of truth in this as we observe our individual and collective lives. Have you ever felt completely well-nourished, healthy and whole, in no particular need for "more?" Isn't that when we're most likely to feel spontaneously grateful to be alive, with Love in our hearts, and naturally wanting our friends, fellow humans and all life to share this simple, natural happiness?

Is there any good reason why humanity and the Earth can't move into an awakened consciousness of health and happiness, where our primary motivations are giving and sharing "simply abundant" life on a rejuvenated planet? We've dragged some of the heavy, obsolete, "bad" reasons into the new century, e.g. our hyper-competitive, separative, egocentric systems in every field, creating a mental climate that encourages the horrendous exploitation of humanity, animals and the whole crying Earth. While we are greedily getting and getting and sucking dry our generously giving Mother Nature, we've neglected our critical role as givers and replenishers. Now in 2018, while we've so far miraculously managed to avoid nuclear self-destruction, it is clear that Nature's finite reserves of quality soil-water-vegetation-air-climate-and-beauty are being severely depleted worldwide. Therefore, a future in which we and Earth are alive and healthy clearly depends on a dramatic flowering of our true, generous minds and hearts to enable the essential symbiotic human-Earth regeneration.

Psychologist Abraham Maslow (*The Farthest Reaches of Human Nature*) wrote that we have a "hierarchy of needs" and, until our primary survival needs of adequate food, water, shelter and security are met, our "higher" needs or aspirations to share in conscious evolution and giving from our deepest nature of Intelligence and Love cannot be realized. Ecologist John Hamaker (*The Survival of Civilization*) wrote that most of us are more or less deficient in multiple essential nutrients, thanks to the "efficiency" of modern agribusiness, based on mining and poisoning the soil and ignoring "the Law of Return,"

among others. Add the many toxic byproducts of diets based on cooked and "refined" animal and vegetable conglomerations, the alcohol, tobacco and other drugs used to suppress pain and "stimulate" vitality, and we see a human race in deep trouble: a naturally beautiful, intelligent, inspired and aspiring human race largely "on hold," having yet to meet even its primary need for natural, fresh, pure mineral-vitamin-protein-enzyme-rich foods. Consider very deeply how much this can explain the manifestations of a global sickness—including the worldwide epidemic of "the hunger to get" and the relative scarcity of "a happy mind in a healthy body" and "the hunger to give."

Since neither the U.S. Department of Soil Fertility Mining nor the profit-driven Medical Symptom Suppressing (usually body-destroying) Business nor the largely "corporate-

Fruit tree planting, Kauai, Hawaii

sponsored" governments appear ready to eliminate the causes of disease and support the causes of health, I suggest we each let our own lives be meaningful in leading the way toward personal and planetary Regeneration. Since the "health care" bill is up to $3.3 trillion per year in the U.S. alone, 1 of every 2.15 people is expected to develop cancer, and soil depletion worsens annually, obviously it is time we each respond fully and wisely.

Let us start with the soil as our foundational life-support system, and establish a new, consciously symbiotic garden-culture relationship with the Earth via soil, food, air, sunlight, trees and vegetation. Where else would one start?! If enough individuals, families and local communities consume produce from organic, remineralized and composted soil while extending their garden, orchard and farm land, and embracing the beautiful principles of the ever-more comprehensively described Natural Hygiene, I think we'll see a Global Health and Earth Regeneration Revolution quickly underway. What is the current percentage of people who'd choose to trade their present quality of life and health for a life of human-and-planetary health-building work and play in conscious cooperation with friends, family and the Natural World?

While the addictive aspects of the "rat-race" can be difficult to shake, those who have seen the potentials of the Natural Design, encompassing health, sanity, meaningful work, creativity, love, and joy, will surely opt for the "human race" to create Paradise on Earth. Losing this race due to lack of inspired responsibility could soon bring us to starvation in an impoverished Biosphere with very harsh climates.

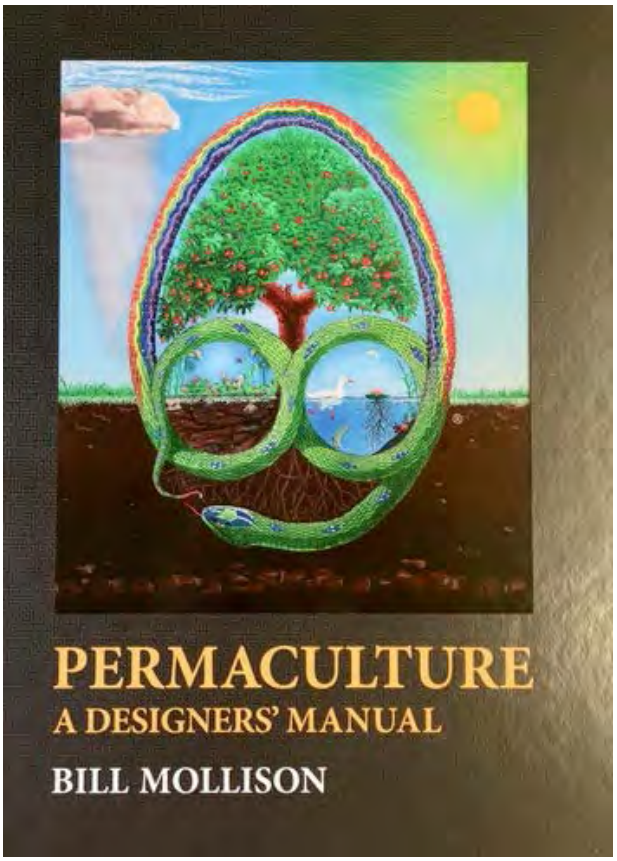

Just as wholistic doctors ("teachers") try to consider "the whole person," it is obviously time to strive to become wholistic ecologists concerned with "the whole planet." It seems the least we can do for the planet which gave birth to us and will sooner or later recycle our bodies. As of 2018, I think a realistic view leans toward "sooner." However, let us remember our great capacity for awakening, understanding, transformation, and love-in-action. Why not do all we can to nourish these possibilities? Let us each realize that we truly do reap what we sow!

PART I

DIET

Pathologies of Modern Diets

by David Klein, Ph.D., Dr. T. C. Fry & Wes Peterson, N.D.

The Big Destructive Mistake

by Dr. T. C. Fry & David Klein, Ph.D.

The #1 mistake humankind makes several times every day is eating foods which we are not designed to eat, that is, foods which are not suitable to our biological and physiological constitution and which poison and destroy the body and mind, causing virtually every disease condition humans face. We are not omnivores! Omnivorous diets that are high in grains and their byproducts and/or meat and animal byproducts are acidifying, toxifying, and deficient in nutrients. They destroy human health, causing physical and mental degeneration, low fertility, most disease conditions from A to Z, stunted longevity and they greatly contribute to the pollution of the world's environment and the decline of global societies.

Just as kerosene fouls up an automobile or airplane engine, which was not designed for it, so too will foods foul up human bodies if they are not designed to handle them. If you are not physiologically adapted to a diet, it will be repulsive to you in its raw natural state—you cannot relish the food nor sustain yourself on it in good health. When you eat an unnatural diet by artifice, that is, by denaturing it by cooking and modifying and camouflaging its taste with condiments and so on, you are doing the following:

1. Deranging and destroying most or all of the nutrients within the food.

2. Deranging your taste buds through excitation with toxic substances to make the unpalatable food acceptable.

3. Potentially inflaming your organs. All poisonous substances, including alcohol, pungent spices, vinegars, salts, onions, garlic, chili peppers, hot sauces, and charred meat, are harsh irritants that can cause inflammation and impose insurmountable burdens

upon the body's defense system and organs of purification and elimination. A host of diseases results from their habitual use.

4. Causing nutrient deficiencies by eating a partially or wholly nutrient deranged "food."

5. Causing protein malnutrition. Cooking destroys proteins and amino acids. Once oxidized and destroyed by cooking, you can no longer derive any benefit from proteinaceous substances other than, perhaps "empty calories," that is, nutrient-bereft fuel. Once oxidized, proteins are soil (food) for bacteria which putrefy (rot) it. Bacterial putrefactive byproducts are highly toxic and carcinogenic. These byproducts are methane gas (the source for smelly gas emissions when you eat beans, for instance), hydrogen sulfide and mercaptans (which yield the rotten egg smell when carried out by the methane gas), cadaverine, putrescine, ammonias, indoles, skatoles, leukomaines and a profusion of other toxic and carcinogenic substances.

6. Laying the groundwork for putrefactive bacterial flora that will vitiate your intestinal tract. Eaters of cooked foods and wrong foods have about two pounds of bacterial flora up and down their digestive tracts. Raw food eaters have only a few ounces.

7. Laying the groundwork for alcohol and vinegar poisoning. Heated sugars and carbohydrates are readily fermented by fungi and bacteria with, first, alcohol as a byproduct and then vinegar which is dozens of times more toxic than alcohol.

8. Intoxicating your body with the toxic debris (deranged nutrients) of what once had nutrient value. Instead of materials your body can use, you have toxins that put the body into a frenzy and, if overwhelmed by the toxic load, into a pathological state.

9. Overstimulating your nervous and endocrine systems, which in some people sends their sex drive into overdrive, which is a prime cause of the world's overpopulation.

Slabs of carcinogens

10. Deranging our brain chemistry, resulting in reduced cognition and disconnection from our elegant bio-spiritual nature, instigating aberrant behaviors and, consequently, worldwide turmoil. This new study helps make the point: "Intake of Raw Fruits and Vegetables Is Associated With Better Mental Health," from *Frontiers in Psychology* magazine: https://www.ncbi.nlm.nih.gov/pmc/articles/PMC5902672/.

As you can see, cooked foods and condiments are a curse to our well-being.

There are many toxic substances that are commonly eaten. For instance, all cooked oils and fats, as in fried foods, meats, nuts and seeds, contain deadly carcinogens. Their aerated fumes are worse in the lungs than tobacco smoke! For the bare truth about cooking, refer to the landmark report *Diet, Nutrition and Cancer* (1983) that was commissioned by the U.S. National Academy of Sciences (https://www.nap.edu/catalog/371/diet-nutrition-and-cancer).

The list of toxifying pseudo-foods seems endless! We Americans poison ourselves so much that we have more health problems per capita than any other country on earth. More than 16% of our national wealth goes down the disease rat hole. Humanity must wake up to the fact that virtually all discomforts, illnesses and suffering are abnormal, unnatural and unnecessary.

Is Cooked Food Good for Us?

by Dr. T. C. Fry

In nature all animals eat living foods as yielded up by nature. Only humans cook their foods and only humans suffer widespread sicknesses and ailments. Those humans who eat mostly living foods are more alert, think clearer, sharper and more logically and become more active. Best of all, live food eaters become virtually sickness-free!

Cooking is a process of food destruction from the moment heat is applied to the foodstuff. Long before dry ashes results, food values are totally destroyed. If you put your hand just for a moment into boiling water or on a hot stove, that should forever persuade you just how destructive heat is. Food is usually subjected to these destructive temperatures for perhaps half an hour or more. What was living substance becomes totally dead very rapidly with exposure to heat!

Cooking renders food toxic! The toxicity of the deranged debris of cooking is confirmed by the doubling and tripling of white blood cells after eating a cooked food meal. The white blood cells are the first line of defense and are, collectively, popularly called "the immune system."

As confirmed by hundreds of researches cited in the prestigious National Academy of Science's National Research Council's book, *Diet, Nutrition and Cancer*, all cooking quickly generates mutagens and carcinogens in foods.

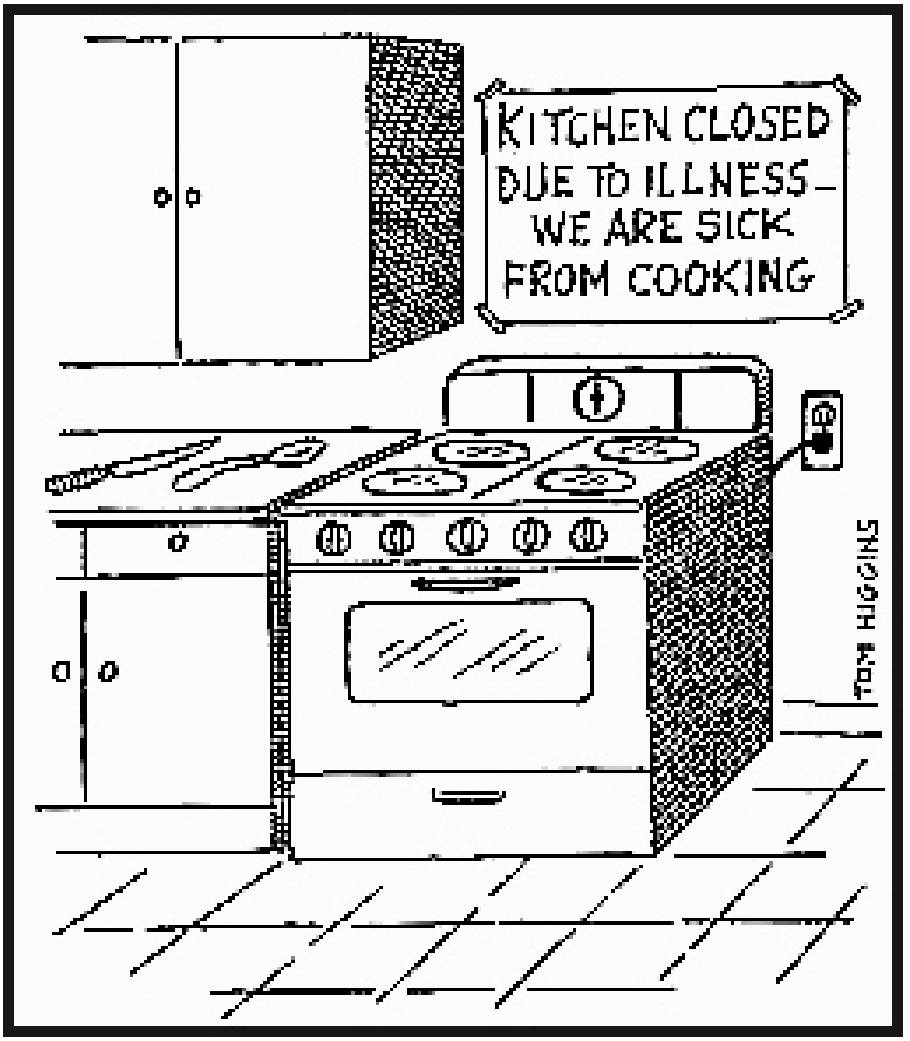

Proteins begin coagulating and deaminating at temperatures commonly applied in cooking, and are devoid of nutritive value.

Vitamins are rather quickly destroyed by cooking.

Minerals quickly lose their organic context and are returned to their native state as they occur in soil, seawater and rocks, metals and so on. In such a state they are unusable and the body often shunts them aside where they may combine with saturated fats and cholesterol in the circulatory system, thus clogging it up with cement-like plaque.

Heated fats are especially damaging because they are altered to form acroleins, free radicals and other mutagens and carcinogens as confirmed in *Diet, Nutrition and Cancer*.

Thus you can see that dead foods make dull, low vitality, and diseased people.

Cooked Food Effects
by Wes Peterson, N.D.

During the past few decades there has been much research done in the area of nutrition. Some of this research casts light on some important insights regarding the foods Mother Nature offers to us in its whole, raw state, and what happens when we tamper with them.

What exactly happens to food when it is cooked? What happens to the body if we eat cooked food? Some key points are covered in this article.

Key Points Regarding the Effects of Cooking on Food and Health

• The food's life force is greatly depleted or destroyed. The bioelectrical (energy) field is altered and greatly depleted (as is graphically demonstrated with kirlian photography). Live and bioactive (raw) food is rendered dead and inert.

• The biochemical structure and nutrient makeup of the food is altered from its original state. Molecules in the food are deranged, degraded, and broken down. The food is degenerated in many ways. Fiber in plant foods is broken down into a soft, passive substance which loses its broom-like and magnetic cleansing quality in the intestines.

• Nutrients (vitamins, minerals, amino acids, etc.) are depleted, destroyed, and altered. The degree of depletion, destruction, and alteration is simply a matter of temperature, cooking method, and time.

• Up to 50% of the protein is coagulated. Much of this is rendered unusable. High temperatures also create cross-links in protein. Cross-linked proteins are implicated in many problems in the body, as well as being a factor in the acceleration of the aging process.

• The interrelationship of nutrients is altered from its natural synergistic makeup. For example, with meat, relatively more vitamin B-6 than methionine is destroyed, which fosters atherogenic free radical-initiating homocysteine accumulation (which is a factor in heart problems).

• The water content of the food is decreased. The natural structure of the water is also changed.

• Toxic substances and cooked "byproducts" are created. The higher the cooking temperature, the more toxins that are created. Frying and grilling are especially toxin-generating. Various carcinogenic and mutagenic substances and hordes of free radicals are generated in cooked fats and proteins in particular.

• Heat causes the molecules involved to collide, and repeated collision causes divalent bonding in order for new molecules, and hence a new substance, to form. In an ordinary baked potato, there are 450 byproducts of every description. They have even been named "new chemical composites".

• Unusable (waste) material is created, which has a cumulative congesting/clogging effect on the body and is a burden to the natural eliminative processes of the body.

• All of the enzymes present in raw foods are destroyed at temperatures as low as 118 degrees Fahrenheit, killing the living foods. These enzymes, named "food enzymes," play a small, yet perhaps important, role in digestion. (The body's own digestive secretions do the bulk of the digestion work.)

• After eating a cooked meal, there is a rush of white blood cells towards the digestive tract, leaving the rest of the body less protected by the immune system. From the point of view of the immune system, the body is being invaded by a foreign (toxic) substance when cooked food is eaten.

• A general augmentation of white corpuscles in the blood and a change in the relative proportions of different blood cells occurs. This phenomenon is called "digestive leukocytosis."

• The natural population of beneficial intestinal flora becomes dominated by putrefactive bacteria (particularly from cooked meat), resulting in colonic dysfunction, allowing the absorption of toxins from the bowel. This phenomenon is variously called dysbacteria, dysbiosis, or intestinal toxemia (toxicosis).

• A buildup of mucoid matter is created in the intestines. Mucoid plaque is a thick tar-like substance which is the long-term result of undigested and uneliminated cooked food putrefying in the intestines.

• Cooked starches and fats in particular are a major culprit in constipation and clogging of the intestines.

• A buildup of toxins and waste material occurs in many parts of the body, including within individual cells. Some of these toxins and wastes are called lipofuscin, which accumulates in the skin and nervous system, including the brain. It can be observed as "liver spots" or "age spots."

• Malnutrition occurs at the cellular level. Because cooked foods are lower in nutrients, in addition to containing wastes and toxins, individual cells don't receive enough of the nutrients they need.

• There is a tendency towards obesity caused by overeating. Because the cells don't get enough nutrients they are, so to speak, "always hungry" and hence "demand" more food. Cooked food is also less likely to be properly metabolized, which is another factor in excess weight gain.

• From time to time the body experiences detoxification crises (also called purification or healing crises). This happens when toxins are released through the skin or dumped into the bloodstream for elimination by the liver, kidneys, and other organs. The symptoms may include headaches, fever, nausea, vomiting, colds, bronchitis, sinusitis, pneumonia, diarrhea, etc.

• The body can become so toxic that all kinds of particles, such as pollen, can cause detoxification crises, called "allergies." An estimated 80 million Americans suffer from such "allergies."

• The immune system (which is more accurately described as our defense system), having to handle the massive daily invasions of toxins and toxic byproducts, eventually becomes overwhelmed and weakened; this is a key factor in the aging process.

• Some of the waste material builds up in the arteries and clogs them, leading to high blood pressure, atherosclerosis, arteriosclerosis, strokes, etc., killing an estimated 50% of Americans.

• The wastes, toxins, mutagens, and carcinogens that build up within cells, as well as the daily onslaught of excess free radicals, eventually causes some cells to become cancerous, killing an estimated 30% of Americans.

• In general, the natural aging process is accelerated by cooked food. People who switch to raw food often become biologically and visibly younger.

From Cancerologist Dr. Bruce Ames regarding "Mutagenesis, Carcinogenesis, and the Degenerative Diseases of Aging," cooking food is plausible as a contributor to cancer. A wide variety of chemicals are formed during cooking. Four groups of chemicals that cause tumors in rodents have attracted attention because of mutagenicity, potency, and concentration:

- Nitrosamines are formed from nitrogen oxides present in gas flames or from other burning. Surprisingly little work has been done on the levels of nitrosamines in fish or meat cooked in gas ovens or barbecued, considering their mutagenic and carcinogenic potency.
- Heterocyclic amines are formed from heating amino acids or proteins.
- Polycyclic hydrocarbons are formed from charring meat.
- Furfural and similar furans are formed from heating sugars.
- Heating fat generates mutagenic epoxides, hydroperoxides, and unsaturated aldehydes, and may also be of importance.

Leukocytosis and Cooked Food

In 1930, research was conducted at the Institute of Clinical Chemistry in Lausanne, Switzerland, under the direction of Dr. Paul Kouchakoff. The effect of food (cooked/processed vs. raw/natural) on the immune system was tested and documented. Dr. Kouchakoff's discovery concerned the leukocytes; the white blood cells. Apparently, a well-known phenomenon occurred immediately after a person ate.

It was found that after a person eats cooked food, his/her blood responds immediately by increasing the number of white blood cells. This is a well-known phenomena called "digestive leukocytosis," which means that there is a rise in the number of leukocytes, or white blood cells, after eating. Since digestive leukocytosis was always observed after eating, it was considered to be a normal physiological response to eating. No one knew why the number of white cells would rise after eating, since this appeared to be a stress response, as if the body was reacting to something harmful, such as infection, trauma, or exposure to toxic chemicals.

A Remarkable Discovery

Back in 1930, Swiss researchers of the Institute of Chemical Chemistry studied the influence of food on human blood and made a remarkable discovery. They found that eating unaltered, raw food or food heated at low temperatures did not cause a reaction in the blood. In addition, if a food had been heated beyond a certain temperature (unique to each food), or if the food was processed (refined, added chemicals, etc.), this ALWAYS caused a rise in the number of white cells in the blood. The researchers renamed this reaction "pathological leukocytosis", since the body was reacting to highly altered food. They tested many different kinds of foods and found that if the foods were not overheated or refined, they caused no reaction. The body saw them as "friendly foods". However, these same foods, if heated at too high a temperature, caused a negative reaction in the blood, a reaction that is found only when the body is invaded by a dangerous pathogen or trauma.

The Worst Offenders

The worst offenders of all, whether heated or not, were processed foods that had been refined (such as white flour or white rice), or homogenized (a process in which the fat in milk is subjected to artificial suspension), or pasteurized (also seen in milk, flash-heated to high temperatures to kill bacteria), or preserved (chemicals added to food to retard spoilage or to enhance taste or texture). in other words, foods that were changed from their original God-given state. Good examples of these harmful foods are: pasteurized milk, chocolate, margarine, sugar, candy, white flour, and regular salt. The researchers found that if these altered, chemical foods were chewed very thoroughly, the harm to the blood could be lessened. In addition, another amazing finding was that if some of the same food in its raw state was eaten with the cooked counterpart, the pathological reaction in the blood was minimized. However, avoid these unnatural, processed foods; replace them with delicious whole foods for optimal health.

Homo Sapiens the Frugivore

by Dr T. C. Fry & Dr. Douglas Graham & David Klein, Ph.D.

The Great Potential

by David Klein, Ph.D.

It is the most magnificent of all creations, unsurpassed in its elegance; astonishing in its physical capabilities; the perfect self-healer; a sensational masterpiece of Divine expression.

I am talking about your body, healthy and fit, completely detoxified, all of its biological needs being met, living in harmony with Nature with youthfulness and abundant vitality. Deep down, isn't that what you have always longed for?

Do you wonder what is holding you back from having the joyous, high-energy-illness-free life you have always desired, from living up to all of your capabilities, fulfilling your potential and realizing your loftiest dreams?

It could be that the vehicle that takes you around in life is not able to perform well. Why? Most likely because you have not been operating it properly. If you've been eating a processed food diet with bread, meat and dairy, your body is harboring toxic wastes; its fluids and tissues are polluted, bowels fouled, and organs impaired or damaged.

The toxins drag down your energy, rob your health, wreak your emotions, dull and poison your mind, and age you rapidly on your way to a painful death. The toxins must

come out!

The good news is that your body knows how to get all of the pollution out; it knows how to detoxify; it is trying to do so right now! It simply needs to be cared for properly. This begins with eating like the frugivore that you truly are and adopting The Fruitarian Diet. There is no more powerful endeavor to improve your health. The rewards for living healthfully on the Fruitarian Diet are innumerable. Please continue reading...

Some Outstanding Facts for Your Consideration

by Dr. T. C. Fry

1. While in a state of Nature, humans and as well other species developed natural equipment and faculties for finding, taking, consuming, efficiently processing and utilizing foods which they adapted to.

2. Despite the many and varied diets consumed by humans over the globe, our instinctual dietary nature and faculties have not evolved away from our pristine foods.

3. The foods upon which we developed in nature necessarily nourished us adequately to bring us to our high state of development. The foods to which we adapted in Nature will still sustain us adequately and amply by meeting all our varied nutrient requirements.

4. With our modern botanical and horticultural expertise, we are capable of producing our natural foods of a quality that will continue to meet our nutrient needs and enable us to attain our highest potentials.

5. Symbiosis and cooperation exist in Nature to an extent most people do not realize. Educational texts and media do not teach our symbiotic role in Nature. Humans existed symbiotically in Nature, as did (and still now do) all undomesticated and unfarmed animals; humans ate fruits and dispersed the seeds, thereby perpetuating the fruit species and the human species, fulfilling our integral roles in the Grand Web of Life.

Comparative Anatomy
by Dr. Douglas Graham

How does one determine the correct food for any given creature? Let us suppose that you were given a baby animal and you had no idea what it was or what it was supposed to eat. Perhaps it was a gift from a foreign land. How would you know what to feed it?

The answer is relatively simple. All you would have to do is offer the creature different types of foods in their whole, natural state. That which it was designed for, it would eat. It would likely ignore all the other items, not even considering them as food. I have done this successfully with orphaned animals that I have saved.

The same technique would work with a human child. Put the child in a room with a lamb and a banana. Sit back and watch to see which he plays with and which he eats. We can be fairly sure of the outcome. Try again with fats versus fruits by offering a choice of (natural, raw, unsalted) nuts, seeds, avocados, or olives on the one hand and any fresh sweet fruit on the other. Again, we can safely predict that the child will choose the sweet fruit.

Humans vs. Carnivores

The following is an incomplete list of the major differences between humans and carnivorous creatures.

Walking: We have two hands and two feet, and we walk erect. All of the carnivores have four feet and perform their locomotion using all fours.

Tails: Carnivores have tails.

Tongues: Only the truly carnivorous animals have rasping (rough) tongues. All other creatures have smooth tongues.

Claws: Our lack of claws makes ripping skin or tough flesh extremely difficult. We possess much weaker, flat fingernails instead.

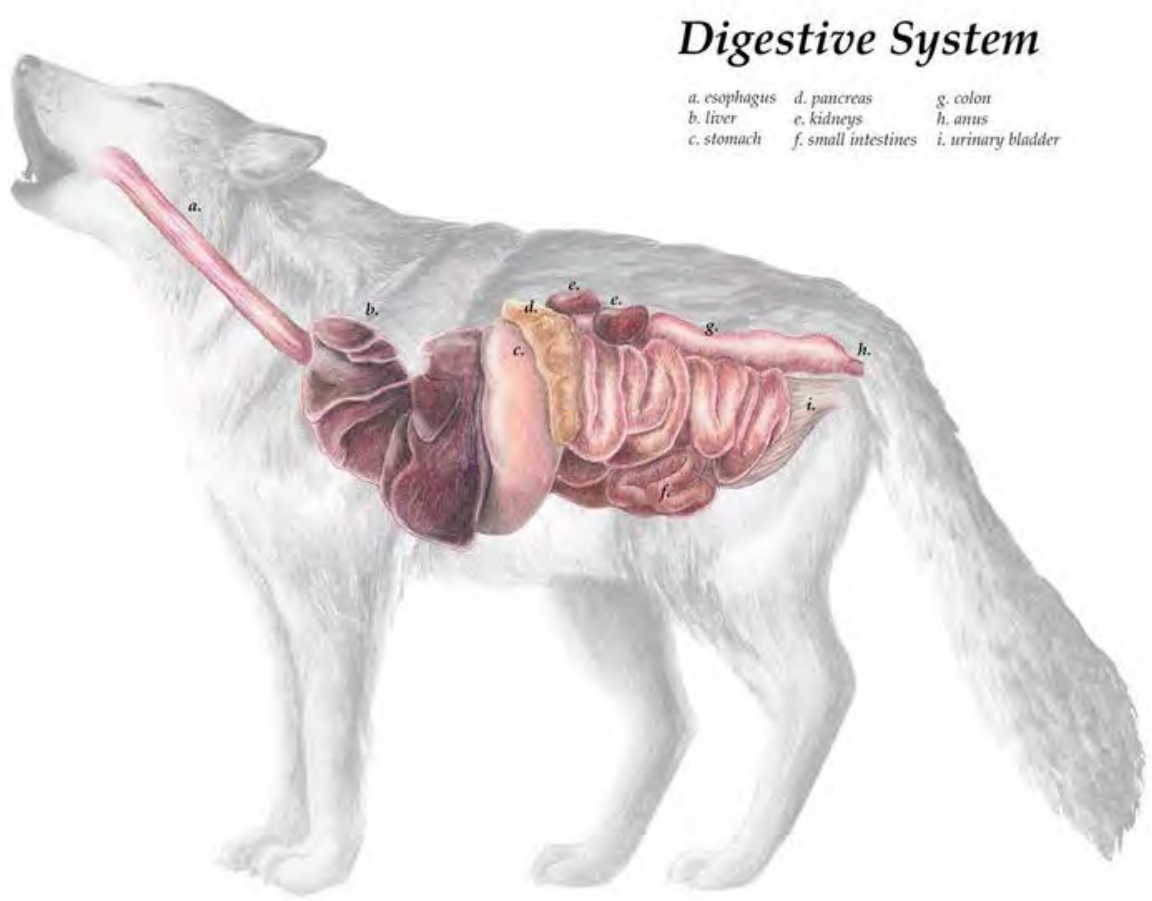

Opposable Thumbs: Our opposable thumbs make us extremely well equipped to collect a meal of fruit in a matter of a few seconds. Most people find the process effortless. All we have to do is pick it. The claws of carnivores allow them to catch their prey in a

matter of seconds as well. We could no more catch and rip the skin or tough flesh of a deer or bear barehanded than a lion could pick mangos or bananas.

Births: Humans usually have children one at a time. Carnivores typically give birth to litters.

ColonFormation: Our convoluted colons are quite different in design from the smooth colons of carnivorous animals.

Intestinal Length: Our intestinal tracts measure roughly 12 times the length of our torsos (about 30 feet). This allows for the slow absorption of sugars and other water-borne nutrients from fruit. In contrast, the digestive tract of a carnivore is only 3 times the length of its torso. This is necessary to avoid rotting or decomposition of flesh inside the animal. The carnivore depends upon highly acidic secretions to facilitate rapid digestion and absorption in its very short tube. Still, the putrefaction of proteins and the rancidity of fats is evident in their feces.

Mammary Glands: The multiple teats on the abdomens of carnivores do not coincide with the pair of mammary glands on the chest of humans.

Sleep: Humans spend roughly two thirds of every 24-hour cycle actively awake. Carnivores typically sleep and rest from 18 to 20 hours per day and sometimes more.

Microbial Tolerance: Most carnivores can digest microbes that would be deadly for humans, such as those that cause botulism.

Perspiration: Humans sweat from pores on their entire body. Carnivores sweat from the tongues only.

Vision: Our sense of vision responds to the full spectrum of color, making it possible to distinguish ripe from unripe fruit at a distance. Meat eaters do not typically see in full color.

Meal Size: Fruit is in scale to our food requirements. It fits our hands. A few pieces of fruit is enough to make a meal, leaving no waste. Carnivores typically eat the entire animal when they kill it.

Drinking: Should we need to drink water, we can suck it with our lips, but we cannot lap it up. Carnivores' tongues protrude outward so they can lap water when they need to drink.

Placenta: We have a discoid-style placenta, whereas the carnivores have zonary placentas.

Vitamin C: Carnivores manufacture their own vitamin C. For us, vitamin C is an essential nutrient that we must get from our food.

Jaw Movement: Our ability to grind our food is unique to plant eaters. Meat eaters have no lateral movement in their jaws.

Dental Formula: Mammalogists use a system called the "dental formula" to describe the arrangement of teeth in each quadrant of the jaws of an animal's mouth. This refers to the number of incisors, canines, and molars in each of the four quadrants. Starting from the center and moving outward, our formula, and that of most anthropoids, is 2/1/5. The dental formula for carnivores is 3/1/5-to-8.

Teeth: The molars of a carnivore are pointed and sharp. Ours are primarily flat, for mashing food. Our "canine" teeth bear no resemblance to true fangs. Nor do we have a mouth full of them, as a true carnivore does. I am reminded of one of Abraham Lincoln's favorite retorts: "If you counted a sheep's tail as a leg, how many legs would it have?" Invariably, people would answer, "five." To which Lincoln would respond: "Only four. Counting the tail as a leg doesn't make it one."

Tolerance of Fat: We do not handle more than small quantities of fat well. Meat eaters thrive on a high-fat diet.

Saliva and Urine pH: All of the plant-eating creatures (including healthy humans) maintain alkaline saliva and urine most of the time. The saliva and urine of the meat-eating animals, however, is acidic.

Diet pH: Carnivores thrive on a diet of acid-forming foods, whereas such a diet is deadly to humans, setting the stage for a wide variety of disease states. Our preferred foods are all alkaline-forming.

Stomach Acid pH: The pH level of the hydrochloric acid that humans produce in their stomachs generally ranges about 3 to 4 or higher but can go as low as 2.0. (0 = most acidic, 7 = neutral, 14 = most alkaline). The stomach acid of cats and other meat eaters can be in the 1+ range and usually runs in the 2s. Because the pH scale is logarithmic, this means the stomach acid of a carnivore is at least 10 times stronger than that of a human and can be 100 or even 1,000 times stronger.

Uricase: True carnivores secrete an enzyme called uricase to metabolize the uric acid in flesh. We secrete none and so must neutralize this strong acid with our alkaline minerals, primarily calcium. The resulting calcium urate crystals are one of the many pathogens of meat eating, in this case giving rise to or contributing to gout, arthritis, rheumatism, and bursitis.

Digestive Enzymes: Our digestive enzymes are geared to make for easy fruit digestion. We produce ptyalin—also known as salivary amylase—to initiate the digestion of fruit. Meat-eating animals do not produce any ptyalin and have completely different digestive enzyme ratios.

Sugar Metabolism: The glucose and fructose in fruits fuel our cells without straining

our pancreas (unless we eat a high-fat diet). Meat eaters do not handle sugars well. They are prone to diabetes if they eat a diet that is predominated by fruit.

Intestinal Flora: Humans have different bacterial colonies (flora) living in their intestines than those found in carnivorous animals. The ones that are similar, such as lactobacillus and E. coli are found in different ratios in the plant eaters' intestines as compared to those of the carnivores.

Liver Size: Carnivores have proportionately larger livers in comparison to their body size than humans.

Cleanliness: We are the most particular of all creatures about the cleanliness of our food. Carnivores are the least picky, and will eat dirt, bugs, organic debris, and other items along with their food.

Natural Appetite: Our mouths water at the sights and smells of the produce market. These are living foods, the source of our sustenance. But the smell of animals usually puts us off. Meat eaters' mouths water at the sight of prey, and they react to the smell of animals as though they sense food.

How to Determine Our Natural Biological Diet

by Dr. T. C. Fry

Exogenous and Aesthetic Requirements of Our Natural Vibrant Foods

This concerns the properties foods must have to meet the human biological disposition. Needless to say, within the bounds of our concept, our natural foods self-evidently existed in nature sufficiently to supply the needs of the populace of the time. They had to be available in plenitude, otherwise adaptations would not have occurred that we can easily determine. In plenitude of its natural foods, a species thrives and increases in numbers. In times of scarcity a species suffers famine and, sometimes, starvation within the area affected. Humans normally have reserves sufficient to carry them through famines for 50 to 60 days. Almost all species have adaptations that enable them to survive deprivation for periods of time.

Aesthetic Requirements of Our Natural Foods

To have been a natural food for humans, their needs must have been met for a period sufficiently long to have occasioned the development of equipment and faculties that appreciated it, and that surely and efficiently apprehended, acquired, consumed, digested, absorbed and utilized it.

Our natural foods, therefore, must arouse our attention and desires as they exist or existed in nature. To attract our attention as foods, our natural foods must be beautiful to the human eye. Our sense of beauty revolves around that which is consonant with our well-being. This is called our aesthetic disposition. This sense developed and became fixed by experience interacting with and modified by that which yielded value, that which was endowed with the qualities that repeatedly gratified and supplied our physiological needs.

1. A natural food must appeal to the eye. The first requisite of a natural food is that it must attract the eye in its natural state. Our eyes are our foremost organs of discovery. Experience and instinct must fix a recognition of the food as desirable.

2. A natural food must tantalize the sense of smell. To be a natural food it must be redolent, aromatic or fragrant enough to arouse desire in those that smell it with their olfactory senses.

3. A natural food must be easy to apprehend and acquire with our natural faculties. The third requisite of a natural food is ease of discovery and acquisition with our natural faculties. With our eyes, sense of smell, physical faculties, especially our legs, feet, arms and hands, we must be able to acquire quantities sufficient to meet our needs within our diurnal time frame.

Our Natural Foods Must be Easily Consumed in Their Natural State as Modified By Our Natural Faculties Only

Foods of our biological and symbiotic nature are not always ready to consume. After acquisition they usually require some external processing in order that their nutrients be easily bitten off, chewed and swallowed. Humans are the most fastidious of all eaters on earth, rivaled perhaps only by other primates such as the chimp, orangutan and gorilla.

External food processing for humans means we must prepare the food for mouth by peeling off skins, cracking of shells, and otherwise exposing the food portion to the teeth such that bite-sized morsels may be facilitated.

Our Natural Foods Must Be a Gustatory Delight in Their Natural State

Humans lived for millennia in nature before they became tool users and mastered fire. Tools do not occasion evolvement, but rather the fixation of existing faculties. Therefore

any food, to be natural, must excite our palate and be delightful in the natural unfired state. The eating of a natural food must be a cherished and palate-ravishing experience, as all acts necessary to our well-being are blissful.

Endogenous Requirements of Our Natural Foods

Our natural foods are the raw materials the body's internal faculties use to meet its requirements.

Our natural foods must be replete with our nutrient needs and contain no components which devitalize or poison the body.

Our Natural Foods Will Not Intoxicate or Poison Us!

The first commandment of eating is: "Thou shalt not poison thyself." The average American commits from 10 to 80 poisonings acts daily. Our natural foods contain only components which have inherent enzymes that break them down into their basic nutrients or simplest forms. Our natural foods require almost no enzyme secretion from our secretory faculties for basic digestion. If a food has components or compounds for which we secrete no digestive enzymes, that component is toxic to our bodies and occasions considerable distress to most. Such components or compounds are often referred to as "allergens." A natural food has no "allergens" at all though some of us may be abnormally sensitive to biologically correct foods. The foremost "allergens" are really proper body objection to toxic substances or substances that its faculties cannot digest. Poisons the average American consumes consist not only of recreational drugs, but of foods ingested with toxic components or which, in the course of intestinal transit, are bacterially and/or fungally transformed into toxic putrefactive and/or fermentative products.

Our Natural Foods Must Be Easily and Efficiently Digested and Utilized

Animals in nature are equipped to easily and efficiently handle their natural foods. This is true of humans as well. What other animals may easily digest and assimilate may be impossible for us. We must recognize that many foods are predigested, that is, the enzymes of the foods break themselves down into simple nutrients as needed by their biological symbionts. Predigestion is, of course, the ultimate accommodation between symbionts. The less efficiently the food is digested, the worse it is for you. The more efficiently the food is digested, the better it is for you. Perhaps it can better be expressed

this way: More strain, more drain. Less strain, more gain.

Our Natural Foods Must Have Nutrient Adequacy That Proportionately Supplies Our Various Needs

Editor David Klein's note: I have updated Dr. Fry's dietary reference figures, replacing the Nutritional Research Council RDAs (Recommended Daily Allowances) with modern-day DRIs (Daily Reference Intakes) per the Food and Nutrition Board (FNB), which operates under the US's Institute of Medicine (IOM), within the National Academies (http://nationalacademies.org/hmd/~/media/Files/Activity%20Files/Nutrition/DRI-Tables/1_%20EARs.pdf?la=en). Estimated calorie needs per age, gender and physical activity level were tabulated by the US's Center for Nutrition Policy and Promotion, operating under the U.S. Department of Agriculture (https://www.cnpp.usda.gov/sites/default/files/usda_food_patterns/EstimatedCalorieNeedsPerDayTable.pdf).

Food symbiotic to a species amply supplies every nutrient need. This means that it does not undersupply or oversupply any of our nutrient requirements to a burdensome or pathological extent. For instance, grass is a complete food for cattle. If foods are not symbiotic with the consuming species, certain nutrient needs must necessarily be met. Failure to meet nutrient needs results in deficiencies. Deficiencies give rise to many problems other than the obvious deficiency.

The Daily Reference Intakes (DRIs) established by the US's Food and Nutrition Board (FNB) is deemed the most authoritative there is in this country, even though it is partially askew. The parameters and criteria they observed in the setting of the DRIs are relevant only to conventional-living Americans and quite out of line for a healthy person's requirements living on natural foods. Nevertheless, knowing FNB's guidelines and methodologies gives us ballpark proportions of our nutrient needs.

The DRI for an active 50 year-old man is 2,800 calories per day for conventional eaters. If 35% of those calories are from fat, which is the maximum the FNB recommends, that means there are roughly 980 fat calories or roughly 109 grams of pure fat or fats in the solid state, thus leaving 1,820 calories to be supplied by proteins and carbohydrates. As the RDI is 56 grams of protein, 224 calories worth (which we really do not use for fuel), this leaves 1,594 calories to come from carbohydrates. That figures to be about 399 grams of pure carbohydrate. The DRI for the aggregate amount of mineral matter and

vitamins figure out to about 7 grams of solids of the 583 grams of food solids computed above. The RDAs have us consuming, in practice, the following as a percentage or proportion of our diet:

- Carbohydrates: 62% by weight of solids, 57% of calories
- Proteins: 8% by weight of solids, 10% by calories
- Fats: 19% by weight of solids, 35% by calories
- Mineral matter: 1% by weight but as a part of the primary nutrients

It should be noted that mineral matter is actually a part of the protein, carbohydrate and fat portions and has no separate consideration in the DRIs by weight. Vitamins constitute such a small part, 1%, as to have neither weight nor caloric considerations.

As the calories of proteins are for measurement only, there being a greater expenditure of calories in humans in their digestion, deamination and use than is obtained from them, we may not take them into account in the consideration of caloric requirements.

Our Natural Foods Must Adequately Supply Our Caloric Needs

The DRI for our caloric needs is about 50% too high, considering that our natural foods in their natural state yield more usable calories than cooked foods.

Let's look at a study by Drs. Alexander Leaf and Mark Hegstead of Harvard University: the caloric need of an active 154-pound man per day is actually about 1,800 calories.

Our essential fatty acid needs are really only about 1% to 2% of our net nutrient needs by weight according to RDIs, and about 2.25% to 4.5% of our caloric needs. Thus, for nutrient considerations, carbohydrate food solids from which we derive calories can be, and perhaps should be, weight-wise, near 90%.

As fiber is a neutral factor, being virtually unused in its passage through the intestinal tract, we need not consider it as a nutrient even though its caloric values are included in conventional figures because it is a firebox calorie. For convenience sake we'll leave our caloric requirements as being weight-wise and calorie-wise about 90% of our utile diet. It is perhaps an accurate figure for natural food eaters.

Our foremost fuel is glucose and fructose. The body can use these as is. If we eat starches we must heat them to dextrinize them, thus facilitating their breakdown into glucose.

Our starch-eating capability is very limited, which indicates it is not a natural food. As glucose and fructose are our natural sugars, there is about 95% energy gain if we get these directly from our foods, whereas an equal amount of energy in raw starches yields perhaps 40% of its potential (humans secrete no enzymes needed to break down the cellular membranes that protect starch globules—all breakdown is due to crushing and chewing), as long as our limited secretion of the starch-splitting enzyme amylase holds out. When heated to the point of dextrinization of the starch, the cellular membranes burst by expansion. Even so, because of the problems involved with cooked fare, the body can realize only 65% to 70% of the energy potential of starchy foods.

Our Natural Foods Must Adequately Supply Our Amino Acid Needs

Note that I have said amino acids because our actual needs are for amino acids, not proteins. If we eat proteins, they must be laboriously digested, that is, broken down by body enzymatic action into amino acids.

Per Dr. Mark Hegstead of Harvard University, the true need for amino acids by an 154-pound (70 kg) man is about 21 grams per day, or 84 calories. Very active people will need close to 30 grams. The FNB's protein numbers for a 154-pound man are high: 46.2 grams. The FNB's are so high because they agree with Dr. Hegstead's numbers; however, they almost double them to give a safety margin. Beware: when you've got your building built, throwing extra bricks into it may mess things up! Any amount of cooked protein will cause your body-temple structural weakness and reduced vitality!

Twenty-one grams of amino proteins in a diet consisting of about 500 grams of usable nutrient solids required daily is about 4%. In our natural diet the amino acids are about 100% usable whereas in the conventional American diet they are only about 20% usable! The average American consumes about 105 grams of protein daily, but mostly in a cooked form. Cooking coagulates, deranges and deaminates proteins and amino acids, thus rendering them unusable except as carbohydrates. In the cooked and oxidized form they are very readily putrefiable.

Ninety percent of amino acid and protein wastes of the body are recycled. This means that proteins involved in body processes are providentially used and reused. It also means that losses through cellular death are largely reclaimed and reused. The overall loss is thus about 10% of the daily usage. It is estimated that the body of the average

man requires about 230 grams of new protein formation daily. If 90% of this is supplied by recycling spent proteins, then only about 23 grams of new protein need to be consumed. Make it raw amino acids!

Our Natural Foods Must Supply Our Needs For Mineral Matter

Mineral matter that the human body uses consists of minerals in an organic context, that is, in a colloidal form within living substance. Heat quickly destroys the organic context, thus returning mineral matter to an inorganic state. Though super fine in consistency, minerals that were in the organic state become, through the agency of heat or decomposition of their medium, inorganic the same as they occur in soil, rocks, ores, etc. In this form they are not utile by the human body except in certain applications. For example, base minerals will alkalinize the intestinal tract even though they cannot be assimilated.

Minerals which the body requires become toxic if appropriated in an inorganic context. This is easily demonstrable. Leukocytosis is recognized as a pathological state. This is a proliferation of white blood cells, the whole of which is often referred to as our immune system. If the components of a cooked or heat-deranged meal are taken, leukocytosis results. If only inorganic minerals are ingested, leukocytosis likewise results. Leukocytosis is a body defensive act wherein the body unleashes huge armies of white blood cells to apprehend and carry toxic substances to the nearest exit or put them harmlessly under the rug somewhere.

Thus the body must have, according to the RDIs, about 1% of its solid food intake as minerals. To be usable these minerals must be in an un-deranged organic state.

Our Natural Foods Must Supply Our Needs For Fatty Acids

There was, at one time, proclaimed to be three essential fatty acids, namely arachidonic, linoleic and linolenic. Today only linoleic is said by nutritional researchers to be essential. Popularly, linolenic fatty acids are referred to as omega-3 while linoleic fatty acids are referred to as omega-6. Essential means that the body has a need of a component or components, in this case fatty acids, because it cannot itself synthesize them. Our natural foods must, of course, contain our needs for essential fatty acids, because the body never found it necessary to develop faculties to produce them or they were so plentiful in the food the body ceased to produce them and lost its ability to do so as it did with

vitamin C and certain amino acids recognized as essential.

Our Natural Vibrant Foods Must Supply Our Needs For Vitamins

While vitamins comprise such a small portion of our total dietary need that all the RDIs taken together on an annual basis could be put into a sewing thimble, they are, nevertheless, essential to our well-being. The RDIs for vitamins vary with each vitamin. Here I will not deal with individual vitamins as separate components. At this time only the observation need be made that our natural foods must adequately contain these vitamins or give rise to them in absorbable form while in the intestinal tract.

Our Natural Foods Must Supply Our Needs For Miscellaneous Nutrients

The above nutrients are said to be macronutrients though, as can be seen, vitamins are really micronutrients. Other micronutrients which the body may require are auxones (certain plant hormones). The science of nutrition is yet young. Whether or not there are needed nutrients in foods other than the five categories of solids treated above remains open to question.

In any event you can be sure our natural foods are replete with all the nutrients we need in the quantities we require. After all, our virtual abandonment of our natural dietary fare is only a few seconds on the clock if we regard our earthly existence as being 24 hours thus far. And our natural fare is scientifically established as responsible for our high state of development.

Our Natural Foods Should Supply Our Water Needs

Inasmuch as humans, like many desert creatures, are not designed with the oral equipment to naturally drink water, our natural diet should be water-sufficient just as it is in the case of desert animals as well as numerous other creatures in nature.

Healthy people eating their natural diet usually have a surplus of water without drinking. The addition of some foods without sufficient water, less than 25% water content, does not occasion thirst. However, substances with water content equal to or greater than our natural foods occasion thirst if ingested cooked, if they are biologically incorrect, if they are condimented, especially with salt, and toxic substances in general.

While thirst generally arises from pathogenic conditions within, there are exceptions: extraordinarily warm climatic conditions, extraordinarily low humidity, periods without

normal food intake, partaking of good foods that have been dried, heavy labor or exercise under warm conditions, and yet other conditions. When thirst arises, always drink water—pure water. With ready supplies of pure water and tools that facilitate drinking such as cups, glasses, etc., we can easily drink the water necessary to make up deficits.

Our Diet Must be Alkaline, Overall, in Metabolic End-Products

Humans require a diet that is alkaline in its metabolic end-products. For practical purposes this means at least 80% of alkaline-forming foods against not more than 20% of acid end-product foods. The human homeostatic condition is alkaline with essential fluids normally having a pH of 7.40. Any significant variation in the pH can result in coma and death. Acidosis is deadlier than alkalosis. The body can rather easily discharge excess organic alkalis, but must first neutralize excess acids. In the absence of sufficient alkalis, the body must take alkaline minerals, including calcium, from bones and fluids to effect neutralization. Americans eat a predominantly acid-forming diet, a diet that is not only pathogenic in itself, but causes such complications as base mineral depletion characterized by osteoporosis and metabolic disorders.

What Would You Eat in Nature? Considering Various Foods and Our Natural Disposition

Despite the gross perversion of our instincts, they are still alive and well and will reassert should we be relegated back to nature. Therefore, this quest is to ascertain what we would eat in nature. Our instinctive foods, the foods which helped to develop us to our magnificence, necessarily contain all that we need to thrive on. This assurance being soundly based, as you will soon determine for yourself, it then behooves us, as responsible members of society, to undertake the course which makes us the most we can be so that we can maximally serve ourselves and those who depend on us. This is a mutual arrangement, as those whom we serve in turn serve us better. This exalts everyone and has a ripple effect that makes all in our society healthier and happier, more loving and more caring. In serving yourself best, you at the same time serve others best. This inquiry will survey almost all the foods that humans, in their varied habits, eat. We'll consider each as a possible food for ourselves as it occurs in nature without benefit of cooking apparati, tools and containers.

Remember, your instincts will reject or cherish each food on its merits; that is, its appeals

to your senses and palate; the only criteria that guided us to food selection in plentiful nature. Our premises are: that Mother Nature, i.e., the sum of all factors and influences under which we lived in nature, served us correctly to start with, inasmuch as we thrived and attained our high station in its midst; that what was right for us then is still right for us in view that we're still structurally and physiologically the same as we were during most of our sojourn as humans in Nature; that we can still, within our modern context, supply ourselves with natural foods substantially and significantly; and that we can also observe, meaningfully, the other requisites of life in our modern context.

Pertinent Questions—the Answers to Which Determine Our Natural Diet

Are we herbivores?

Are we graminivores?

Are we root grubbers?

Are we insectivores?

Are we carnivores?

Are we eaters of fermented and rotten foods?

Are we sucklings of animals?

Are we frugivores?

Are we vegetarians?

Are we nut and seed eaters?

Are we fat eaters?

Are we protein eaters?

Are we starch eaters?

Are we all the foregoing, that is, omnivores?

Are We Herbivores?

Herbivores are natural consumers of herbage such as grass, weeds, leaves, stalks and stems. Does foraging in nature for grass, weeds and leaves appeal to you? Do grass and weeds attract your eye, tantalize your sense of smell and excite your palate?

Of course it is repulsive to you for the very simple reason that it cannot satisfy your needs. You do not secrete cellulase or other enzymes that break down these plants as herbivores do. Therefore you cannot derive your foremost need from them, namely simple sugars which is your body's primary fuel. Rather, the processing and problems caused by their ingestion occasion a net loss of energies.

Of course, humans do consume some herbage such as lettuce, celery, cabbage family members (kale, cabbage, collards, Brussels sprouts, cauliflower, broccoli, bok choy, etc.), spinach and yet other leafy greens. Plain, as they occur in nature, these vegetables really do not appeal to us though we can cultivate a taste for much of it. At least cauliflower and broccoli do yield some calories and all yield, to the extent when digested, proteins, some essential fatty acids, mineral matter and vitamins. But, if we get enough of these nutrients from our natural foods, then these are not needed from plants that we do not eat raw with keen relish.

If we had to rely on herbage exclusively for our foods, we'd adjust somewhat but, in all likelihood, slowly starve as the calorie yield is negative or very low. While cooking destroys most of the abundant nutrients, it also converts the cellulose, fibers and other components into usable caloric values.

Let's face it: although we will include vegetables in our dietary, we're not primarily vegetable eaters by nature. Obviously we're not herbivores.

Are We Graminivores?

Being graminivorous means we live from grasses and grass seeds though grass eaters are really called herbivores. Strict grain eaters are called graminivores. Many birds in nature live on grass and weed seeds. Gramnivorous land mammals, such as horses, have large, flat teeth for grinding hard grain kernels and tough grasses. Grass seeds include

wheat, oats, rye, barley and rice which were developed by human mastery of nature only within the last 10,000 years. There are thousands of other grass seeds that occur throughout nature.

Of course, we'd all reject grass seeds as items of diet in nature. First, they are in a condition we can neither masticate nor digest. Being heavy on starches, we would gag on the equivalent of a spoonful or two. You might try a mouthful of wheat berries without husks removed as you must eat them in nature. Won't work for us. Furthermore, if you ate a tablespoon of raw flour made from grass seeds (cereal grains), you'd gag.

As grass seeds neither attract, tantalize nor arouse us in their raw natural state, we can reject them as natural human fare even though most of the human race presently consumes grains. Thus, we are not natural graminivores.

Are We Natural Root Grubbers?

Animals that naturally grub for roots have snouts. As most roots are starchy, root grubbers secrete a plethora of starch-splitting enzymes whereas humans secrete only one such enzyme, amylase, in very limited quantities. Humans abhor dirt, are quite fastidious and refuse to eat anything dirt-covered or even dirt-tinged. Grubbers such as hogs and boars pass lots of dirt through their bodies. Without tools, humans are very poor diggers. They have no motivation to do so for there are no foods below ground that, in their natural state, please the palate. Humans can handle very little that comes out of the ground in its raw natural state. Some roots, notably turnips, rutabagas, sweet potatoes, yams, ground nuts, beets, carrots, parsnips and salsify can be eaten raw. In Nature we would be obligated to do without tools and would have to eat them raw or not at all. In our natural habitat of plenitude, we can be

sure that roots which man could handle without tools received precious little attention as food.

In view of the considerations, you can write off humans as natural root grubbers and I'm sure you'll concur.

Are We Insectivores?

There are humans who eat insects, especially grasshoppers and ants. But, by and large, humans would give insects a big "yuk" when it comes to eating them, especially in the raw state. For the gourmands who eat them, they must fry them in batter or chocolate-coat them, a way of saying they are not delicious fare in themselves. There are many birds that live exclusively on insects when and where they are plentiful. There are bats which live on insects. But I know of no humans who do.

The average person is repulsed by insects rather than attracted to them as yummy foods. I don't relish them raw or cooked and I don't think you do either.

Are We Carnivores?

A carnivore is an eater of carnage or flesh. This does not accurately portray animals said to be carnivores. Animals that live on other animals usually consume most of the animal, not merely the flesh. True carnivores lap the flowing and oozing blood of their prey with relish. They delight in the guts and its partially digested contents. And they will consume the bones and gristle (collagen or cartilage). Dogs, for instance, require about 1,700% as much calcium as humans, for animal flesh is extremely acid-forming. Blood and bones are required to offset the acidic end materials. They also require about 1,200% more protein than humans. When you note the relish and gusto with which dogs go for whole animals, you can be sure that what carnivores need for their nourishment is quite delicious to them.

Do you relish the idea of crushing the life of a rabbit with your bare hands and teeth? Can you lick its blood with gusto, getting it over your face, hands and body? Would you dig into its guts with pleasure? Would you love to chew on its bones and gristle? Would you love to swallow chunks of its flesh, not being fastidious about swallowing hair and vermin that might be involved? Would you like to do the same for any plant-eating animal that you could apprehend, kill and consume while still in its warm and fresh state?

Of course, you and every unperverted person loves animals as fellow creatures on earth. Killing them is repulsive to you and eating them in the freshly-killed state is even more disgusting to you. Yet, most of us do consume flesh and some organ meats while rejecting blood, bone, most fats and the entrails or offal. But we kill our animals by proxy. We denature and derange flesh and organs with heat and camouflage it with condiments. Does this describe a carnivore to you? Would you, in a state of nature, relish chasing down animals and eating them? Again, this is alien to your natural disposition and actually sickening.

True carnivores also secrete an enzyme called uricase to metabolize the some 5% uric acid in flesh. We secrete none and thusly must neutralize it with our alkaline minerals, primarily calcium. The resulting calcium urate crystals are one of the many pathogens of meat eating, in this case giving rise to or contributing to gout, arthritis, rheumatism and bursitis.

Are humans natural meat-eaters? There are too many considerations in physiology, structure (miscalled anatomy), aesthetic disposition and psychology that characterize us as non-flesh-eaters to even seriously entertain such notions.

I had a nutritionist tell me in front of an audience that we had canine teeth and that proved our meat-eating character. I responded with: "You really mean dog teeth, don't

you? Like fangs?" This caused her to redden. Then I related one of Abraham Lincoln's favorite retorts: "If you counted a sheep's tail as a leg, how many legs would it have?" Invariably the answer was "five." To which Lincoln would respond: "Only four. Counting the tail as a leg doesn't make it one."

I think you'll agree that we are not equipped in any aspect of our being as carnivores.

Are We Eaters of Fermented and Rotten Foods?

Substantially all of Americans eat fermented and putrefied substances that are called foods. When fats oxidize and decompose they become rancid and repulsive. Carbohydrates ferment when decomposed by fungi (yeast) and bacteria. And proteins putrefy (rot) when decomposed by bacteria and fungi.

It is odd that we will discard fermented grapes, yet drink their fermentation end-product called wine. Odder still, most Americans consume with relish something that never occurred in nature: a pathogenic putrefactive product called cheese. Cheese represents about all the decomposition products in a single package: rancid fats, putrefactive products and fermentation products.

Bacterial and fungal (yeast) fermentation produce alcohol, vinegar (acetic acid) and lactic acid with other byproducts of methane and carbon dioxide. Proteins, decomposed primarily by anaerobic bacteria but also by fungi and aerobic bacteria, have as decomposition end-products ptomaines (putrescine, muscarine, neurine, cadaverine, ptomatropine and yet other toxic compounds), indoles, leukomaines, skatoles, mercaptans, ammonia, methane, hydrogen sulfide and yet other toxic compounds. You need only to refer to a good dictionary to learn just how poisonous these products are. Yet, Americans eat billions upon billions of pounds of cheese annually.

Cheese is made by taking the casein portion of milk and rotting it with types of bacteria that yield byproducts that many palates have come to treasure. That all these poisons going into the system cause anything less than sicknesses, diseases and debility is misrepresentation. Tumors and cancer are often the result.

Humans consume many fermentation, rancid and putrefactive products. Most are derived from milk. Some are derived from grains (especially the alcohols), fruits (wines and certain vinegars), legumes (especially the soybean and its train of putrefactive products), and decomposed meats.

As humans could not consume these decomposed products in nature without tools and containerization, we may safely categorize them as unnatural. I dare say that you agree.

Are We Sucklings of Animals?

I doubt that humans ever directly suckled cattle, goats, mares, camels, sheep and other animals. And, of course, the idea of doing this is obnoxious to our disposition. I refer, facetiously, to milk drinkers as secondhand grass eaters although, to be sure, grass has all the nutrients necessary to support life.

While we can live on milks (certain Africans, like the Masai, live substantially on milk and blood, thus reducing themselves to parasite status), these are by no means our natural foods. Milk-drinking as a regular part of our intake is only a few hundred years old with the exception of certain Arabic and African peoples. Milk-drinking is pathogenic. If milk and milk products were discontinued today, millions of people would cease to suffer sicknesses and pathologies within a short period. In fact, if this alone was discontinued, the hospitals would virtually empty out and physicians' waiting rooms would be mostly vacated.

Milk-drinking is also an act by proxy. If we had to get milk directly from the teats of animals by suction, I'm sure we'd skirt milk altogether. I would and I'm sure you would too.

Are We Frugivores?

Are we a species of fruit eaters? Would you, in nature, relish ripe, vibrant grapes, peaches, melons, bananas, apples, plums, oranges, mangos, avocados, tomatoes, figs, berries and the thousands of other fruits? Would fruits attract your eye, tantalize your sense of smell, and be a gustatory delight in their raw natural ripe state? Would you prefer anything that occurs in nature to a juicy sweet watermelon?

Man has always had a love affair going with fruits. Even through all his perversions, he has continued to relish fruits. Fruits are the natural food of humans and the only food category ideally suited to all their faculties. This does not mean we should eat fruits totally and exclusively in our present circumstances, but it does mean that, in nature, that's all we ate as attested to by anthropological evidence scientists have uncovered, notably Dr. Alan Walker of Johns Hopkins University.

Of course, you go for fruits in their raw state regardless of what else your acculturization and circumstances dispose you to eat. Your instincts are still alive and well despite perversions. Many myths have been built around and about fruits. As a fruitarian I can offer a new dietary for those who say we're not—their own words!

Nutritionists, so-called, are the creatures of training dictated by the meat, grain and milk trusts. These trusts are part of the dominant commercial interests that dictate what will be taught in our educational institutions from universities down to kindergarten. Nutritionists are trained like seals to parrot the propaganda which will induce the populace to consume their masters' products, with the basic five food groups being one of the primary propaganda weapons put at their disposal to serve their masters. Of course, there are renegade nutritionists and dietitians who have revolted against the basic four except for the fruit and vegetable category. Most nutritionists are ashamed of the fifth food category and don't even mention it though it is on the books along with the basic four.

The fifth category consists of what might broadly be termed "accessory foods" such as oils, syrups, snack foods, sugars, wines, seasonings, jams, preserves, etc. Even though we are admonished to eat from all five food categories daily by the framers of this scheme to peddle commercial products, nutritionists and dietitians are not keen on mouthing this part of the propaganda even though they include it liberally in their recipes.

While some nutritionists and dietitians praise fruits and vegetables, they still characterize those who point out our biologically correct foods as faddists and nutritional quacks. Yet, even in seminars, those who sharply question me must admit that, aesthetically, they would eat little besides fruits in nature and that we humans are naturally fruitarians.

All the criteria heretofore cited as the requirements of our natural foods are amply met by fruits. In short, they are replete with our nutrient requirements in practically the proportions that we need them. We are biological symbionts of fruit-bearing plants, and in nature would eat very little besides fruits. Despite all this, there's no particular harm in eating green leafy vegetables, stalks, stems and their fresh juices in the raw state. Even some steaming or conservative cooking of tubers, stalks, stems, roots, corms and selected legumes and grains (preferably sprouted), are not sufficiently deleterious to seriously harm our health. Of course, there are some toxic results from eating all this fare. We're better off without them. Yet, I repeat, there is no great harm in their consumption relative to what is suffered from conventional fare.

Dr. Bruce Ames of the University of California, Berkeley, has created a catalog of poisons in vegetables and published an extensive article in the September 23, 1983 issue of *Science* magazine. No indictment of fruits as having toxic substances was made or can be made. Virtually every vegetable was indicted. All were a part of the same study. Humans are biologically equipped to handle most fruits.

When ripened, fruits accommodatingly convert their carbohydrate components into glucose and fructose, simple sugars we can use without further digestion. Their enzymes convert their proteins into amino acids and their fats into fatty acids and glycerols. Thus, when we eat fruits, all we need do is savor their goodness. The fruit portions, that is, mesocarps, were specifically compounded to attract biological symbionts. Fruits meet their nutrient needs rather ideally with predigested nutrients. For humans, no other food compares with fruits in satisfying all needs including, of course, our requirement for deli-

ciously vibrant soul-exalting fare.

I'm sure that you will agree through your own senses that fruits would be your primary food in a state of nature.

Are We Vegetarian?

The average American understands the term vegetarian to mean an "eater of vegetables." But, in reality a vegetarian is someone who eats only plant-derived foods. This may include a preponderance of fruits but, in practice, it means anything and everything besides animal products.

The word vegetable derives from the Latin *vegetus,* meaning lively, exciting or animated. It does not mean specific types of foods other than those which enliven or sustain us in an energetic mode. Necessarily, by this definition, fruits are high-energy foods whereas vegetables are either low-energy foods or have drawbacks. Typical present-day vegetarian fare includes grains, tubers, root, stalks, stems, leaves, nuts, seeds, fruits, legumes and about everything else that does not move, bleed, cry or resist acquisition.

Even though those who eat all fruits or a preponderance of them can correctly be called fruitarians, they may also be correctly called vegetarians. Personally, my intake is mostly fruit. I prefer to be called a fruitarian, though I do not object to being called a vegetarian. Do you agree that, naturally, we are fruit-eaters?

Are We Nut and Seed Eaters?

In nature there is no doubt but that humans did consume some nuts. Even so, our ability to derive nuts from their hard shells is limited. We do not have razor sharp teeth and tons of pressure per bite or jaw-power as have squirrels. Humans can crack certain nuts with their teeth. Very few of today's degenerated version of humans can do it, but most nuts can be cracked with strong jaws and good teeth. Even strong hands can crush nuts if at least two are taken and pressed against each other.

Most nuts are delicious to us in their raw state. Unfortunately, our ability to handle nuts is rather poor—we'd need pointed, durable teeth, as rodents have, to gnaw through nut shells. Nuts that we savor are in a storage form,

that is, as fats, proteins and invert sugars or starches. Digestion of nuts into fatty acids, amino acids, and glucose is a long drawn out process, most often taking hours. Whether we did or did not consume nuts in nature makes little difference to us today. Most of us do consume nuts but disadvantageously as cooked fare. Heated fats and proteins are quite pathogenic, yes, even carcinogenic. Nuts should be eaten raw or not at all.

Technically and botanically nuts are fruits. I do not buy that because the word fruit really means product or result. Fruits are really the mesocarps of seed packages which plants created specifically as a product to be consumed by a biological symbiont who would incidentally discard and distribute the seeds. Nuts and seeds were created by plants for broadcast and reproduction by other methods. All nuts are seeds. Most seeds are in a storage form to survive the vagaries of climatic and consuming elements so that they may be instrumental in reproducing and perpetuating their kind. Nuts, however, have extra protection in that they have hard woody shells. Seeds usually have only fibrous coatings as their protection. Both seeds and nuts are heavily endowed with nutrients sufficient to initiate and sustain a certain minimum growth of their plants. We can benefit from these nutrients. But if we eat more than two or three ounces, we're likely to get more protein and fats than we can readily handle.

Certainly nuts and seeds were not created by plants for consumption but, rather, for reproduction. That some animals have adapted to their consumption has not been a two-sided affair as it has been with fruits where the love affair has been and still is mutual. There are many types of seeds: legumes, grains, weeds, nuts, and fruit seeds being among the most prominent. In their natural state humans can handle very few of these seeds. Nuts can be digested and used in very small amounts. Likewise, sesame, pumpkin, squash, sunflower, pignolias, and some other seeds can be used.

We are primarily carbohydrate eaters, not fat and protein eaters. I dare say you agree with my assessment of nuts and seeds as human fare.

Are We Fat Eaters?

In nature there are very few fats we can get in any quantity without violating our biological disposition. Avocados, durians, olives, coconuts, nuts and seeds are heavy on fats. Avocados and durians furnish fats in a predigested state when ripe. Coconuts furnish fats as monoglycerides/glycerols before they set their fats as triglycerides in a storage

form. Coconuts are, therefore, in the jelly-like state, easily digested. When matured and hardened, it is almost impossible to digest them.

Broccoli and cauliflower have considerable fatty acids in an easily usable state when eaten in the raw fresh condition. However, they give some unwanted toxic sulfur compounds. We get predigested fats adequate to meet our fatty acid needs from fruits. An occasional avocado or seeds and nuts are quite satisfying. Those who subsist substantially on fats do not do well. Eskimos are very short-lived. They consume about 200 grams, about 1,800 calories, daily. Their short-lived condition is probably more attributable to their heavy protein consumption than fats. They consume about 200 grams of protein daily incidental to their fat-eating and this places a great burden upon their organs, especially liver and kidneys. Because of the acid-forming properties of metabolized proteins, Eskimos lose their teeth at an early age and suffer severe osteoporosis. Eskimos are eaters of animal fats and proteins, primarily as derived from fish. Be it noted that, during the berry-picking season, Eskimos are said to eat only berries during the short season they are ripening.

Biologically we are not a species of fat eaters, but incidental eaters of fats. We do not need to store great quanties of fat, as do bears and sea lions. Ripe fruits contain adequate quantities of predigested fats in the form of fatty acids that are easily handled. Other forms of fat require hours for their digestion, quite atypical of fruits to which we are most favorably disposed. Fats may lie in the small intestine several hours before bile is secreted into it with which to emulsify them, thus exposing them to lipases which reduce them to monoglycerides (fatty acids) and glycerols.

I adjudge that we are not a species of fat eaters except incidental to our fruitarian disposition.

Are We Protein Eaters?

To hear the exponents of the meat trust, you'd think we're in imminent danger of disease and death if we fail to eat meat three times a day. The truth is that eating meat three times daily will cause the very conditions we're taught to fear. We're in no danger of protein deficiency unless we're eating a 100% cooked food diet. On the other hand, there are grave dangers in eating cooked proteins. At normal cooking temperatures, proteins are coagulated, deaminated and largely oxidized. The nitrogenous materials are soil for putrefactive bacteria. The carbohydrate portions of cooked proteins are usable for caloric values but still present the problems that cooked carbohydrates pose.

If we must eat proteins, we must eat them raw to derive their full benefit. But proteins, per se, are not created as food. They are created by plant and animal life as components of organisms, seeds, enzymes, ova, etc. Most proteins of this nature have toxic protective compounds. The bean family have anti-enzyme factors. Eggs have avidin. Nuts also have anti-enzyme factors. Seeds of peaches, apples and many other fruits have hydrocyanide. Humans do not secrete the enzymes to negate or break down these toxic substances.

From fruits we derive as much protein as is present in mother's milk for a growing baby! Moreover, fruit proteins come to us predigested as do other ripened fruit components. There are many alarmists who warn us about protein deficiencies of fruits and many other presumed deficiencies. If we developed in nature on fruits to our high state as anthropologists have found, then the real deficiencies are in the thinking of those who proclaim deficiencies. Their evidence is usually based on researches with pathological specimens, especially those whose metabolic and assimilative faculties are very impaired. They base their thinking from a standpoint of disease rather than health, from a modality and curing mentality rather than a correction of pathogenic practices. In saying that our natural foods are deficient, they are simultaneously proclaiming improvidence in nature. Or, in effect, saying: "God, you made a terrible mistake in providing for us and especially in giving us a sweet tooth." Advocating the consumption of proteins and yet more proteins when those so advising know by their own researches and knowledge that the pro-

teins will be cooked and contribute to heavy pathology is nothing less than criminal.

One more consideration: If we ate only proteins in their raw state we'd quickly become diseased and perhaps even suffer death! Why? Because various amino acids require from about 60% to 137% of their carbohydrate energy potential for their deamination and utilization. The net result would be starvation. That's one reason so much weight is lost by the obese on protein diets. And the intoxication that results from putrefaction is the reason so many of these dieters become diseased with some dying.

Are we protein eaters? Emphatically, no!

Are We Starch Eaters?

To test this question I will not ask you to do the impossible, i.e., take a handful of grass seeds (presuming you could gather them in nature) and start chewing. Or, try a spoonful of flour of any grain. You'd choke up on the first spoon of it as your starch enzyme supply (salivary amylase) would be speedily exhausted. This would amply prove to you that we were not starch eaters in nature when we had not mastered fire. Instead of being a palate-tingling delight, starches are a torturesome affair.

When humans can freely eat starchy roots, grains and tubers such as cassava, taro, potatoes and wheat in their raw state to satiation and proclaim the experience a gourmet treat, then both you and I might accede that we're starch eaters.

Are We Omnivores, That is, All of the Foregoing?

Of course, humans are omnivores in practice with the aid of condiments, taste excitants, denaturalization by cooking, camouflaging seasonings, spices and so on. But, in Nature, we could not

do more than eat foods in season, and we'd have to eat them in the raw state on their own merits with our tastebuds. In nature we were frugivores only.

Humans & Fruit: Symbiotic Partners in Life

While few biology books proclaim symbiosis and none that I've encountered proclaim our own symbiotic role in nature, we are symbionts as are thousands of species. Symbiosis is cooperation between dissimilar organisms for mutual benefit. Symbionts are cooperators in symbiotic living. While the word symbiont is supposed to apply only to the lesser of two cooperating organisms, I prefer to call both of the complementary cooperators symbionts for that is the only nomenclature that makes sense. Let's observe this phenomenon in nature.

We see flowers bloom and put forth tons upon tons of pollen for fertilizing the ovaries of female flowers. Both male and female flowers secrete nectar at their inner base to attract consumption by bees and other insects. In taking such a large reward the bees and insects become contaminated with pollen in the male flowers only to have it removed when they take the nectar of female flowers. The ovaries of female flowers secrete a sticky substance which the bee or insect must come in contact with in taking their nectars. Instances of symbiosis abound in nature.

The above is cited to demonstrate natural cooperativeness or symbiosis. In this case we see that the flowers of plants, both woody and nonwoody, attracted bees and insects to take the free meals provided. This is the way that plants uncannily solved the problem of fertilization, attesting to a high order of intelligence in plant life (which is perceived by few).

Humans do not collect nectar. Even if they did, it would be a very poor food though it sustains bees and insects well. Fertilization in this manner is necessary to certain forms

of plant life to insure that seeds be created with which to propagate the species. As we know, plant life is stationary. Once it has created its seed progeny, a new problem arises, that of scattering the seeds so they will flourish. How did this uncanny wisdom in nature accomplish this?

Among the many solutions was that of creating yet another food around the seed or seeds. In attracting consumption of this food by mobile creature, there was the incidental distribution of its seeds to areas where they would not compete for space and raw materials with the parent plant. Of course, that same immense wisdom dictated the creation of seeds that were unappetizing so they would be discarded rather than consumed.

But the greatest wisdom of all, perhaps, was that which created the food package to proportionately meet the precise needs of its eaters: Those creatures which, in taking and becoming dependent on these foods, became the fruit plant's biological symbiont. That this method of seed distribution was successful is evidenced by the thousands of kinds of fruits created around seeds in nature. Fruits attract human senses in nature and are gourmet delights in their natural ripened state, which ensures their survival. Also, fruits contain no poisons in the fresh ripened state whereas almost all plants and seeds contain components which we cannot metabolize, hence are toxic directly or indirectly.

Fruits in nature are in a predigested form when they ripen. Fruits ripen when their seeds are at a mature stage ready for reproduction. When fruits ripen, they change to brilliant colors and emit seductive fragrances to attract consumption from a biological symbiont. The tree, stalk or vine is rewarded in that its seeds are distributed, thus perpetuating its kind. They are beautiful to behold and emit captivating aromas and fragrances. This makes them irresistibly attractive to their biological symbionts. If all the water and fiber are removed from most of these fruits, the predigested carbohydrates are almost all the same, about 350 calories per 100 grams on average, more than enough to meet the energy needs of biological symbionts. This is about 88% of solids.

In like manner, fruits supply from 4 to 8 grams of amino acids per 100 grams, almost every one of them with all the essential amino acids in about the proportions that humans require, plus, of course, other amino acids. The average amino acid content is about the same as mother's milk for a growing baby. The average is about 6% of solids. When sufficient calories have been consumed to meet caloric needs, intake is almost double our actual daily amino acid shortfall from recycling.

Furthermore, the fatty acids from almost all fruits other than avocados and olives constitute about 1% to 5% of solids other than fiber. These fatty acids are liberal in their supply of the essential fatty acids. The average fatty acid content of fruits is about 2%.

But, importantly, fruits are rich in mineral matter in the most utilizable form in all Nature! Of its solids, about 3% are minerals including, of course, ample calcium to meet our needs if we do not eat more than 20% acid-forming foods and if we do not cook and derange fruit nutrients.

Of the labeled macronutrients, there are vitamins which are really micronutrients; so little as not to be ordinarily measurable. A year of the RDIs for vitamins would not fill a sewing thimble! Yet fruits supply many multiples of the RDIs of vitamins in almost every instance. For instance, vitamin C in fruits sufficient to meet our caloric needs is about ten times as much, on average, as the RDI for it.

Those on the fruit diet have 60% to 70% less need for water than those on the conventional diet, primarily because pathogens require inordinate amounts of water to hold them in suspension and carry them out of the body. Fruits supply ample water in its purest form to meet our needs. Fruitarians do not normally drink water but make as many trips to the urinal as anyone.

As a last consideration, fruits are alkaline in their metabolic end-products. The body readily excretes excess alkalis whereas it must neutralize objectionable acids and excrete them if able. (Arthritis, bursitis, rheumatism, gout and yet other problems are caused by

the body's inability to excrete base salts from acid neutralization, usually calcium salts. For instance the uric acid of meats are neutralized into calcium urate crystals because we do not secrete the enzyme, uricase, as carnivores do. These salts have an affinity for cartilage in joints. Also having this affinity are the acid end-products of grains, oxalic acids in vegetables like spinach, chard, beets and lamb's quarter, most cooked foods, and meats.)

Are we a species of fruit eaters? I'm sure that you will agree through your own senses that fruits would be your primary food in a state of nature. Would you, in nature, relish ripe grapes, peaches, melons, bananas, apples, plums, oranges, mangoes, avocados, tomatoes, figs, berries and the thousands of other fruits? Would fruits attract your eye, tantalize your sense of smell, and be a gustatory delight in their raw natural ripe state? Would you prefer anything that occurs in nature to a juicy sweet watermelon? Man has always had a love affair going with fruits. Even through all his perversions, he has continued to relish fruits.

Fruits are the natural food of humans and the only food category ideally suited to all their faculties. This does not mean we should eat fruits totally and exclusively in our present circumstances, but it does mean that, in nature, that's all we ate as attested to by anthropological evidence scientists have uncovered, notably Dr. Alan Walker of Johns Hopkins University.

Fruits really have it all; all that it took to make us into superb human beings; all that is required to sustain us in a healthy state insofar as food contributes to this condition; and all that we need to live a long, rewarding vibrant and happy life.

Conclusions and Observations

That we are biologically fruitarians is an inescapable conclusion on every count that we can relevantly and validly cite. What does this mean in practical application? Almost everyone you meet will condemn fruitarian fare. Almost everyone thinks from the

standpoint that sickness is inevitable and must be prevented whereas, in fact, diseases simply will not occur unless we cause them, either through deficiencies or intoxications or both. If you eat 70% to 80% fruits and the balance in leafy green salads along with conservatively cooked tubers, roots and even grain products, along with some raw nuts and seeds, you will not significantly or even noticeably impair yourself assuming, of course, that your other practices are good.

There are social considerations that make some concessions on dietary intake preferable to social ostracism. In my own case I merely tell those who inquire about why I'm not eating, or who urge me to eat meat dishes or obnoxious fare, that I'm on a special diet and that, while I'd love to have what is being offered, I don't dare touch it lest I suffer problems. You'll inevitably be assailed by those who tell you about vitamin B_{12} deficiency and anemia. This vitamin is created by both fermentative and putrefactive bacteria. Grass contains no vitamin B_{12} either, yet we are told to eat beef liver among others for B_{12}. Mother Nature was, indeed, provident and provides us amply with our B_{12} needs from our intestinal tract through symbiotic bacterial flora just as with other animals in nature. Experiments with baboons on a fruit diet only for many years could not induce a vitamin B_{12} deficiency in any of them.

It is also rewarding to learn that, in a research to put the fruit-eating fad to rest, Professor Meyer of the University of Pretoria fed 50 controls fruits and nuts only for a period of six months. Instead of deficiencies and disease, the controls became rather sickness-free and greatly improved in health and weight. The results were published in the February 20, 1971 issue of the *South African Medical Journal*.

"Fruit is great fuel. Bananas are the perfect food for people who have an active lifestyle. Self-contained, tasty, eat to eat, satisfying, available year-round, inexpensive, and with the a perfect mix of nutrients, bananas provide practically all of the active person's food requirements. After a long, strenuous workout, what could possibly be more satisfying than a big plate of fresh, cool fruit?"

-Dr. Douglas Graham

Fresh Food Festival Fruitarians, Denmark

The Fruitarian Diet

by David Klein, Ph.D. & Dr. T. C. Fry

Humans have a specific natural biological diet, one which offers complete alkalizing nutrition with virtually no toxicity and is comprised of the most delicious, satisfying and health-promoting foods offered up by Nature. The Fruitarian Diet is based on conclusive evidence that we are biologically, physiologically and anatomically Frugivores. Humans were designed to eat fruit! As such, fruit stands as our natural and most healthful food. Our natural biological diet sets us free of aberrant behavior, rapid aging, disease and suffering, and opens the doors to manifesting the Vibrant Health of our dreams! We call it the Fruitarian Diet. It is also known as the Vibrant Diet, the Hygienic Diet and the 80/10/10 Diet.

The Fruitarian Diet consists of our most naturally healthful, delicious and satisfying foods: raw fruits and vegetables with minimal-to-moderate amounts of seeds, and nuts. The Fruitarian Diet is comprised of a 90% alkalizing foods (minimum) averaging the following caloronutrient ratio: 80% carbohydrates (minimum), 10% protein (maximum), 10% fat (maximum). Seventy-five percent raw is a good place to start, with the goal of working one's way up to 100 percent raw. The Fruitarian Diet reverses and prevents

acidosis, the predominant underlying condition which causes most diseases and the physical degeneration humanity experiences, and it promotes complete healing of most disease conditions and complete rejuvenation, attended by peak strength, endurance, longevity, and a joyful sense of vibrant health. Many have realized these wonderful benefits for themselves, and many more need to receive our vital message and our help in adopting the Fruitarian Diet.

Based soundly and scientifically upon our natural biological disposition—upon our natural physical, mental, emotional, sensory and spiritual needs—you can expect sensational improvements when you eat a vibrant raw food diet and practice the totally effective health system of which it is a part. The health system of which the natural raw food diet is a part is the basis for vibrant, sickness-free well-being! By following this natural and effective system in practice, you almost surely will:

- Detoxify and overcome, once and for all time, occasional illnesses or annoying ailments. Whether it be indigestion, colds, flu bouts, mucus expectoration, headaches, backaches, fevers and "itises" or even such "incurable" problems as acne, allergy, arthritis, asthma, constipation, heart and cardiovascular problems, herpes, psoriasis, skin problems, sinusitis, tinnitus, tumors or whatever, this systems enables you to overcome almost anything simply by discontinuing and removing easily recognized causes, and establishing conditions that build great health.

• Because you'll discontinue and avoid easily recognizable causes of discomforts, sicknesses and disease, you need not suffer even so much as another case of indigestion, aches and pains, fever (itis), sore throat, cough, cold or anything else!

• Normalize your weight if it is excessive. Without dieting or counting calories, a healthful living regimen born of properly meeting our needs causes the overweight to quickly, naturally, safely, surely, and permanently lose down to a naturally normal weight set-point.

• Eliminate physicians, hospitals, drugs, and nostrums from your and your family's lives. You'll also be spared their astronomical costs as well as the aches, pains, discomforts, agonies, and lost time.

• Save thousands of dollars every year in food, energy, medical, hospital, drug, labor, insurance, and other outlays!

• Energize yourself! You'll get more done when your energy levels go up! You become more lovable and charming as you become happier, more radiant and more dynamic.

• Increase your brainpower and mental alertness. Your thinking will be clearer, sharper and more focused. Your IQ and wisdom will increase significantly.

• Have newfound strength, stamina, vigor, and vibrant vitality.

• Enjoy clearer complexion with a glowing and radiant skin tone.

• Speak with an improved voice that tends to bell clearness.

• Restore yourself to relative youth! You'll look, act and feel up to 20 years younger within one to four months.

• Eliminate most digestive problems within 24 hours after going on this marvelous diet.

• Improve your productivity and job performance, thus increasing your income appreciably.

• Feel like a million! You'll have a buoyancy and bounce that even younger people do not have!

• Decrease your sleep needs by about an hour daily even though you'll be better slept,

more alert, and better rested.

• You'll be sharper, more precise and correct in your judgments and assessments, thus enabling you to more accurately and quickly perform both physical and mental tasks.

• When you start doing what you should always have been doing, you'll start being what you always should have been! When you do right, you'll become right.

Note: To assure that the diet you choose is nutritionally complete and well assimilated over years and decades, it is prudent to periodically undergo comprehensive blood tests and full health evaluations by a wholistic doctor. Supplementation with vitamin B_{12} and other nutrients might be necessary for some individuals. When the soils you depend upon are remineralized, soil-life systems are brought back to high levels of bountiful fertility, and your natural foods reach their peak nutrient potential, there might be no need for nutrient supplementation, provided that you live healthfully.

"Fruits and seeds, the noblest and highest products of plant life, form the most luscious and compact representation of condensed sunlight, the highest accumulation of vital energy. They are the perfect foods for man."

Revealing the Sweet Truth About Fruit

by David Klein, Ph.D.

Fear of sweet plant foods is running rampant in most nutrition circles these days. Let's examine the facts concerning our natural biological disposition, so that you may teach the truth about how we are meant to eat and thrive.

The Creator gave us a "sweet tooth" for good reasons:

- Sugar is the preferred and premium fuel used by every cell in our bodies! Our cells run best on glucose. Not fat, protein or ketones—a ketogenic condition is an unsustainable emergency condition that acidifies the body. Our muscles function best when their cells are stoked with glucose. Sugar "burns" cleanly without toxic waste byproducts. In order to be healthy, we need sugar—not refined white sugar, but sugar from whole fruits and vegetables. Fuel up on fruit sugar!

- When we eat sweet whole foods, we are rewarded for obeying our sense of taste. We feel good, nourish and fuel up our bodies, support the maintenance of alkaline balance, and help the planet. The natural order of life calls for humans to eat diets consisting mostly of sweet raw fruits!

- Humans have a symbiotic relationship with fruits. That is, we are natural partners in the web of life with delectable fruits. We enjoy the deliciousness of fruits, receive superior nutrition, disperse the seeds and perpetuate life on our planet.

- Biologically, humans are frugivores! We do best on a fruit-based (fruitarian) diet, which includes vegetables and minimal-to-moderate amounts of raw seeds and nuts. Whole fruits, vegetables, squashes and tubers have good sugar, packaged with a plethora of life-sustaining nutrients.

Commercial interests gave us refined white sugar for bad reasons:

- To pervert our senses and destroy our health with seductively sweet, nutrient-bereft junk, and to ruin the ecology of our planet.

Yes, we should shun refined sugar, but we should NOT fear sugars naturally occurring in fruit!

Key Points For Quashing Fruitophobia

by David Klein, Ph.D.

• Sugar is our cells' premium fuel. For driving our physiological functions in a state of wellness, the cells use the sugar molecule known as glucose. The body converts other forms of sugar (fructose, maltose, sucrose, etc.) to glucose.

• Fearing fruit is a tragic mistake. We should no more fear fruit than we should fear putting high-octane gasoline in our automobile's gas tank! Our cells run on sugar, and sweet raw fruits are the premium source.

• Fruits average 90% water. That is 90% WATER, not 90% sugar! We cannot credibly say that such a diluted sugary food package gives us "too much sugar." If we eat two to three fully satisfying fruit-based meals a day, we will generally be sustained with enough calories to perform all our daily tasks with vigorous energy. No, that is not "too much sugar." And no, we do not have to eat sweet fruit all day to feel satisfied and get enough calories. On a fruit-based diet anchored with bananas, no one starves, and soon we feel satisfied and more alive.

• Humans are frugivores biologically, as confirmed by our anatomy and physiology, and the high vitality and lack of pathology of modern fruit eaters. That means that humans are designed to thrive on a diet of mostly fruits. Our natural diet is a fruitarian diet comprised of primarily sweet fruits, plus vegetables and minimal-to-moderate amounts of raw seeds and nuts.

• Our olfactory senses lead us to fragrant ripe fruits above all other food aromas.

• Our visual sense of aesthetics is drawn to beautiful ripe fruits above all other foods.

• Our hands are designed to pluck ripe fruits.

• Our fingers are designed to peel ripe fruits.

• Our mouth's tastebuds are most responsive and attracted to the sweet foods offered up by nature.

• Our teeth are designed to cleave and mash soft fruit pulp. We don't have flesh-ripping canine teeth as do wild carnivores. Our two tiny "canine" teeth will not do the job—that

term is a misnomer!

• Our mouth is designed to handle water-rich whole foods. We are not designed to drink water, as meat and grain eaters need.

• Our stomach is designed to gently mix light loads of watery food and release meals unnoticeably within an hour.

• Our stomach is not designed to handle diets with heavy meals of mostly fatty high-protein foods, which necessitates hours of secretion of hydrochloric acid and acidic pepsin enzyme, and churning. Fatty and high-protein meals are retained in the stomach for hours, resulting in putrefaction, gas, acidosis and, in some cases, hyper-acidity, acid reflux, inflammation and potentially, cancer. A constantly hyper-acidic stomach engenders coarse emotions, unhappiness and aberrant behaviors,

• Our digestive glands have limited ability to digest foods. Our mineral stores become depleted and we become fatigued if the digestive organs are forced to secrete alkaline and acid digestive enzymes all day long, as necessitated by starchy, fatty, high-protein diets.

• Our small intestine is very long, about 20 feet, and our large intestine (the colon) is about 5 feet long. They are both convoluted, which makes them suited to handle watery digesta and not dry and bulky food masses. Carnivores have straight and much shorter intestines, enabling the efficient elimination of tough, low water-content, bulky animal parts. Fatty and high-protein meals move through the small intestine of humans very slowly. This leads to fermentation, putrefaction, constipation, toxemia and a host of debilitating and potentially deadly diseases, such as intestinal prolapses, inflammatory bowel diseases, hemorrhoids, cancer, etc.

• Our excrement when eating a simple fruit-based diet is non-offensive and non-toxic, as it should be with the world's most highly-developed, elegant beings. And we experience no body odors if we do not overeat or mix nuts and seeds with sweet fruits. Fruitarians who eat correctly have clean bodies. Starch, fat and protein food eaters have dirty bodies with repulsively foul stools. Our pristine senses lead us to enjoy fresh-smelling, clean bodies.

• Ripe fruits offer simple carbohydrates which require little or no digestion. They are

easily absorbed for delivery to our cells within an hour. Complex carbohydrate foods (e.g., grains and white potatoes) require cooking. They take several hours to digest and rarely digest completely, often fermenting and causing illness. They also typically raise blood sugar levels higher than do sweet juicy fruit meals, and they constipate the bowels. Because sweet, ripe, water-rich, organic, whole fruits require very little digestive action and they are 100% toxin-free, the body does not have to expend much energy to metabolize their nutrients and eliminate their residues, and we gain energy from them most efficiently.

• The ideal diet consists of mostly ripe, sweet fruits, rounded out with vegetables and small amounts of avocado, seeds and nuts. The average caloronutrient ratio that has been demonstrated to be optimal for human health and longevity is 80% carbohydrates (minimum), 10% protein (maximum) and 10% fat (maximum), as revealed in studies by Dr. T. Colin Campbell (former nutrition professor at Cornell University and co-author of *Diet, Nutrition and Cancer* and *The China Study*), heart specialist Dean Ornish, M.D., and Dr. Douglas Graham, author of *The 80/10/10 Diet*. Yes, we need to "fuel up" on mostly simple carbs to have high vitality, and nothing provides this better than sweet fruit.

• The cells can derive fuel (calories) from three caloronutrient sources: carbohydrate, protein and fat. If the body is forced to get most or all of its calories from fatty and high-protein foods, it will have to convert fat and protein to glucose. That is a very slow, energy-consuming process that produces a high acid-waste load which tears down our health. Those who adopt and maintain a plant-based 80/10/10 diet generally reverse disease and enhance their longevity. Those who eat diets with greater percentages of protein and fat generally succumb to acidosis, accelerated aging, physical and mental degeneration and the killer diseases endemic to modern Western cultures.

• Babies have not been corrupted by modern heat-processed, cultural foods. They instinctively go for sweet, watery mother's milk, which is about 7% sugar, 4% fat, 1% protein and 88% water (weight-wise)—nearly the same composition as sweet juicy fruits. Infants' pristine senses tell them which kind of food is best. Do young adults, teenagers and adults need more protein than a growing infant? Certainly not! Numerous infants have been observed to thrive beautifully when weaned on their preferred natural first whole food choice: sweet, raw fruit. And numerous children have been observed thriv-

ing on fruit-based diets.

• Our sensorial acuity, emotional sensitivity and the ability to experience the sensations that make us feel truly alive are heightened on a fruitarian diet. A fruitarian diet is the key to a profound bio-spiritual knowing, peace, poise, contentment and even euphoric well-being.

• Fruits are brain foods. They energize and enhance our mental faculties because they supply abundant nutrients and do not require a huge energy-draining digestive process and waste clean-up effort. Their high electrolyte-rich water content promotes the fastest conductance of nerve impulses and neural function. Our mental powers operate at peak, vibrant levels of energy and performance when we eat water-rich, fruit-based diets. Our consciousness is most clear and expansive and we are most spiritually aware when we eat mostly fruit. The hormonal proteins (precursors to neural transmitters) in fruits (especially tropical varieties) trigger the release of feel-good hormones in the bloodstream which make us feel happy and well. We need less sleep and can be more productive on a fruit-based diet.

• The sugars in raw, ripe, non-GMO foods are in no way harmful. Fruit sugar is non-toxic and non-allergenic, and it does not cause cancer or candida. It is unnatural foods that cause illness. Yes, all sugars feed the bacteria and candida yeast in the gut, but they DO NOT CAUSE overgrowths of those microorganisms or trigger the growth of cancer cells. The cause of intestinal bacteria and candida overgrowths and cancer cells is constipating, mostly undigestible, acid-forming, toxic diets based in cooked starches and meat. Those foods clog up and acidify the bowels with digesta that becomes food for bacteria, yeast and mold, generating virulent toxins that add to the body's toxemic load and can cause cancer. In other words, starchy, fatty and high-protein foods hang around in the gut for days and rot (ferment and putrefy) by the action of microorganisms whose natural job is to feast on their nutrients, break them down and breed. STOP THE CAUSE of the bacteria yeast and mold overgrowths while eating a vegan fruit-based diet, and health will be restored. In many cases, cancer cells can perish and be eliminated on an alkalizing fruit-and-vegetable diet. After cleaning out the bowels, sweet fruit eating will become joyful. No one ever got candida from a raw, vegan diet of mostly sweet, water-rich fruits, except those who have taken antibiotics and/or consume great quantities of fat.

Dried fruits can cause problems, as well as eating sweet fruits with fatty foods (e.g., nuts and seeds). Eliminate those foods to restore health, then eat them in moderation.

• Juicy fruits can trigger diarrhea. This is the body's correct self-purification action. We want the body to get rid of the toxic rubbish it was harboring. After a few days of cleaning out on a fruit and vegetable diet, the bowels will be rid of the toxic stool matter, we'll feel better and diarrhea will cease. Diarrhea will only continue under unhealthful eating habits: eating highly undigestible foods and toxic items (such as meat, fried foods, refined flour products, candy, coffee, spices, etc.), and eating incompatible food combinations (e.g., eating sweet fruits with starchy, fatty-high-protein foods, and eating fatty and/or high-protein foods with starchy foods).

• An excess of fatty foods slows down nerve impulses and neural activity, making dull thinkers and lethargic people with low mental and physical energy. Our brains and mental powers operate at low, dulled levels when the bloodstream and other bodily fluids are thickened with fatty fluids and the byproducts of starch fermentation (alcohol and vinegar). Fat is an insulator which, in excessive amounts, slows down neural impulses and all physiological functions. This erodes our health and stifles our consciousness.

• Fatty foods and high-proteins foods are inherently acid-forming. That is, they acidify the blood, forcing the body to extract alkalizing minerals from the bones and other cells to maintain the alkaline pH required for life. This causes acidosis, osteoporosis, organ deterioration, accelerated aging and disease.

• A fat-based diet of mostly meats causes systemic toxicosis, which results in inner turmoil, destructive behaviors and physical and mental degeneration.

• People in meat-based cultures are generally unmindful and uncompassionate. Those who condone the killing of animals have lost touch with their humanity. This cultural lack of respect for life is largely responsible for all of the wars and other turmoil that most of the world is constantly embroiled in.

• Blood sugar levels rise higher after eating meals of complex carbohydrate foods (grains/bread/pasta/white potatoes/taro) than from eating meals of juicy fruits.

• Diets with meals combining complex carbohydrates and fatty foods set up diabetes. The fat impedes the cellular uptake of sugar in the bloodstream, causing the pancreas to

overwork, i.e, forcing it to secrete more insulin than it is capable of producing, thereby ruining its functionality. Fruit does not cause diabetes. In fact, the American Diabetes Association recommends eating fresh sweet fruits.

- Dr. Herbert M. Shelton, Dr. V. Virginia Vetrano, Dr. O.L.M. Abramowski, Dr. T. C. Fry, Dr. Laurence Galant, Dr. Douglas Graham, Dr. Timothy Trader, Dr. Robert Sniadach, and many others, including me, have all thrived on and derived superior results with patients and clients who ate whole-food diets of mostly raw fruit. Don Weaver has enjoyed great health for 41 years on the Fruitarian Diet of 100% raw foods.

- Ultra-marathoners Morris Krok and Michael Arnstein, tennis champion Martina Navratilova, and NBA basketball player Ronnie Grandison have all accomplished great athletic feats on raw, fruit-based diets.

How to Eat Sweet Fruit Correctly

by David Klein, Ph.D.

• Eat mono fruit meals, or one-, two- or three-fruit meals with or without greens for breakfast and lunch, and more thereafter, as desired.

• Exercise vigorously one or more times per day. Eating fruit (or any food) when we have no cellular need for the sugar and other nutrients can lead to metabolic problems. We need to create the need for nutrients (true hunger) by exercising.

• Clean out with water 10 minutes or more before eating. A clean alimentary canal will promote optimal digestion; a soiled alimentary canal leads to fermentation of fruit sugars, mucus production, indigestion and food drunkenness or fatigue.

• Sweet fruits are pre-digested; they need to transit the bowel quickly for quick sugar assimilation. Otherwise, the fruit sugar will hang around too long in the stomach and ferment, causing gastrointesinal problems, toxicosis and discomfort. Therefore, do not eat sweet fruit on a full stomach, or with starchy, fatty and high-protein meals which require hours of digestion in the stomach. Fruit is NOT for dessert! Eat sweet fruits alone or combine them only with greens, celery and/or cucumbers (except melons; eat them alone because they need to exit the stomach quickly). Those "neutral" green foods are low in protein and starch and, therefore, require little digestion time in the stomach.

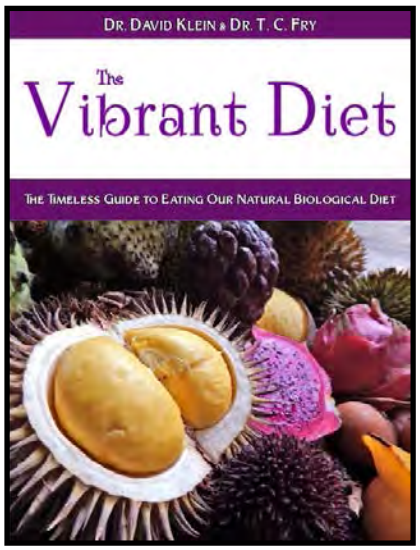

• If you would like to have a meal with fatty foods, i.e., avocado, nuts and seeds, make that your dinner and blend the fatty foods as a dressing for a salad with cucumbers, tomatoes and other vegetables. On average, do not get more than 10% of your daily calories from fat; otherwise, all sorts of health problems will ensue—verify at www.cronometer.com. After eating nuts, seeds or starchy vegetables or any cooked food, wait until the next morning to have your next fruit meal.

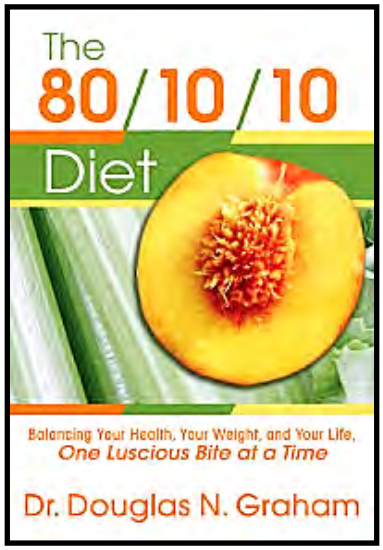

• Eat sweet fruits with greens, celery and/or cucumbers to mitigate overeating of sweet fruits (if you have such a problem). Rather than filling up on the sweet fruits, eat a small portion of them, then some of the green foods; alternate handfuls or eat together as desired. This will also help every body detoxify and flush out bacterial and yeast overgrowths which thrive only in acidic, constipated bowel environments.

Where to Get a Thorough Education in Fruitarian Eating by David Klein, Ph.D.

Because the subject of this ebook is Fruiticulture, we have not devoted the space for a thorough treatise on the "how-to's" of the Fruitarian Diet. To give yourself a thorough education in fruitarian eating, these are three excellent books:

- *The Vibrant Diet* ebook by Dr. T. C. Fry & Dr. David Klein is available at: https://vibranthealthandwealth.com/product/the-vibrant-diet-study-guide-e-book-by-dr-t-c-fry-and-dr-david-klein/
- *The 80/10/10 Diet* book by Dr. Douglas Graham is available at: www.foodnsport.com
- *The Fruit Article*s ebook by Dr. David Klein et al is available at: https://vibranthealthandwealth.com/product/the-fruit-articles-e-book-by-dr-david-klein/
- To browse more publications on fruitarianism, click here: https://vibranthealthandwealth.com

"The joy of this fruit diet lies precisely in the unique flavor of every fresh fruit."
-Essie Honiball

• To become thoroughly knowledgeable about the Fruitarian/Vibrant Diet and certified as a Vibrant Health Teacher-Counselor, Dr. David Klein's Vibrant Health & Wealth Academy offers an online Teacher-Counselor Training Program at: http://www.vibranthealthandwealthacademy.com.

"When planning a meal, nothing compares to the satisfaction of going into your own garden, picking and gathering the finest fresh vegetables and fruits which Almighty God created for your own specific need and sustenance. When you have eaten a few meals composed of organically grown vegetables and fruits, and sprouted seeds in your salads, you quite naturally wish to stay with such fare! There is no reason or justification why you should deprive yourself and your family of the most nutritious food on earth, grown in your own garden."

ECOLOGY

Ecological Effects of Modern Agriculture & Diets

by David Klein, Ph.D.

The effects of modern agriculture and eating have been nothing short of cataclysmic for the environment and all its biota. Statistics for some of these effects have been compiled by EarthSave and Cowspiracy; they are presented in Appendix C. We are running out of time to reverse the rising tide...but it can be done! Via proper education and the global adoption of Fruiticulture and Fruitarian eating, all of the deleterious effects can be totally reversed or, in the case of global climate change, at least stabilized, except, of course, for lost species.

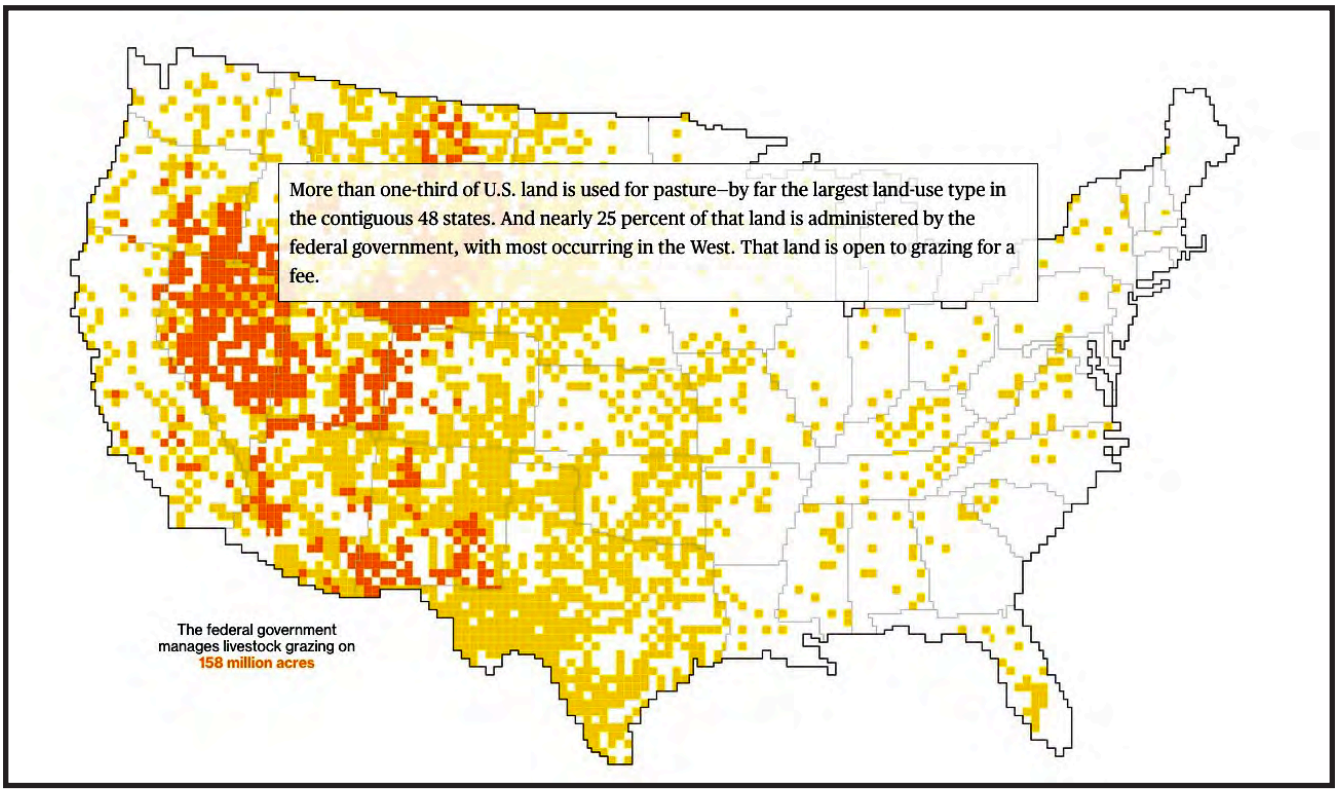

Impacts of Conventional Agriculture on Natural Resources

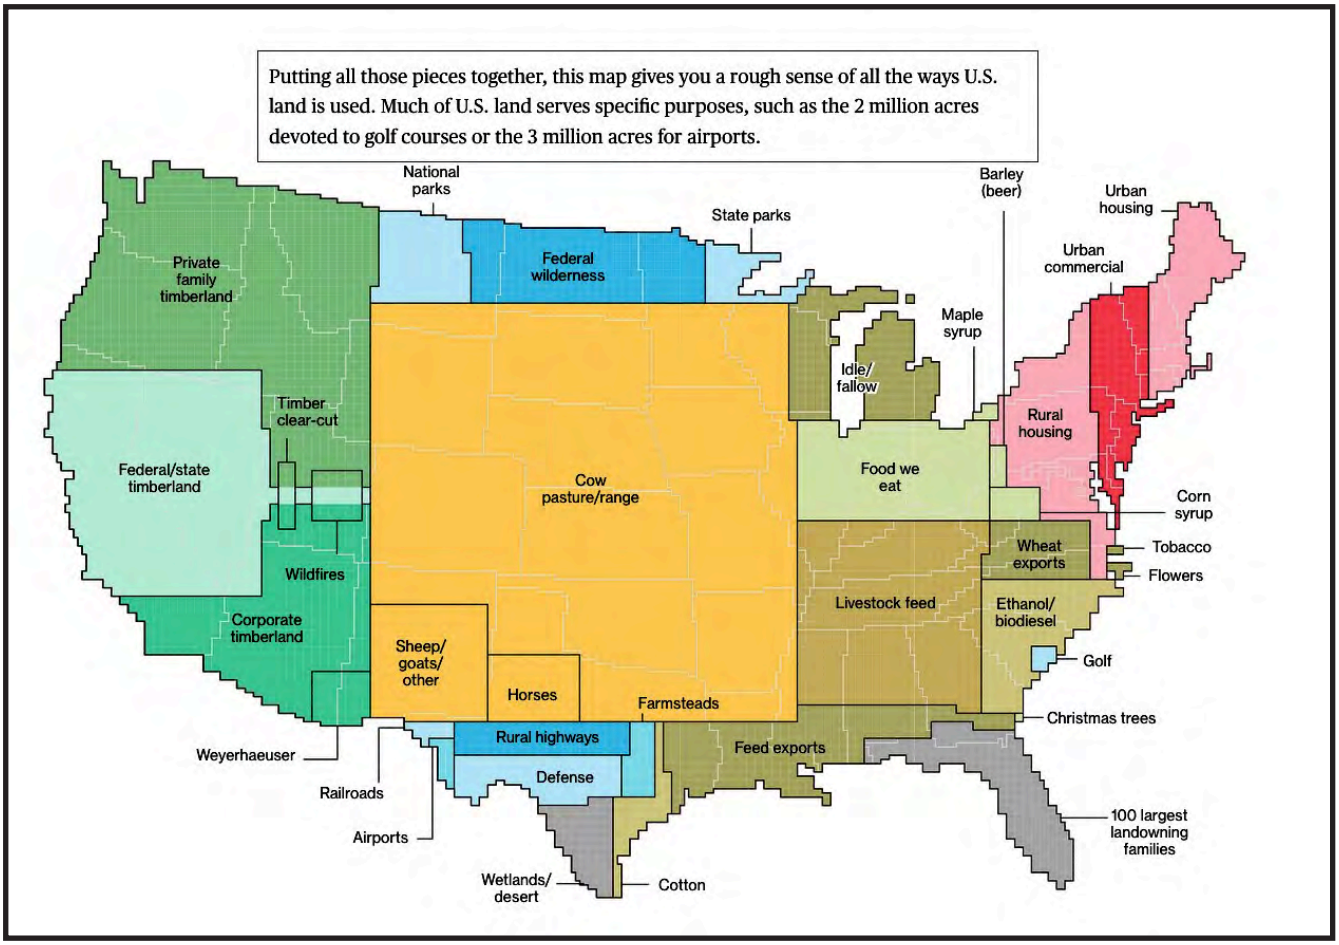

- Contamination of the atmosphere, land and water resources with pesticides, fungicides, herbicides, fertilizers, crop tilling dust, crop waste-burning gases and particulates, and chemical and gas byproducts from food processing and food product manufacturing
- Residues of farming chemicals and drugs on and in food crops and animal feed products
- Reduction and die-offs of bee, butterfly, and other insect, earthworm, soil fungi, soil microbe populations (Read https://phys.org/news/2016-03-pesticides-poisoned-honeybees.html and https://gmwatch.org/en/news/latest-news/16825 and https://gmwatch.org/en/news/latest-news/16825)
- Toxification, acidification, warming and oxygen reduction of oceans, seas, lakes and rivers from agricultural chemical overland runoffs and toxic sewage dumping, in turn causing the toxification and destruction of aquatic life throughout the food chain
- Overdraws of groundwater for irrigation, causing lower water tables and land sinkage
- Overdraws of rivers and lakes, causing eutrophication, deadly algae blooms, potable water decline, and indigenous animal population decline
- Ocean dead zones, and waterway and lake eutrophication from toxic human sewage

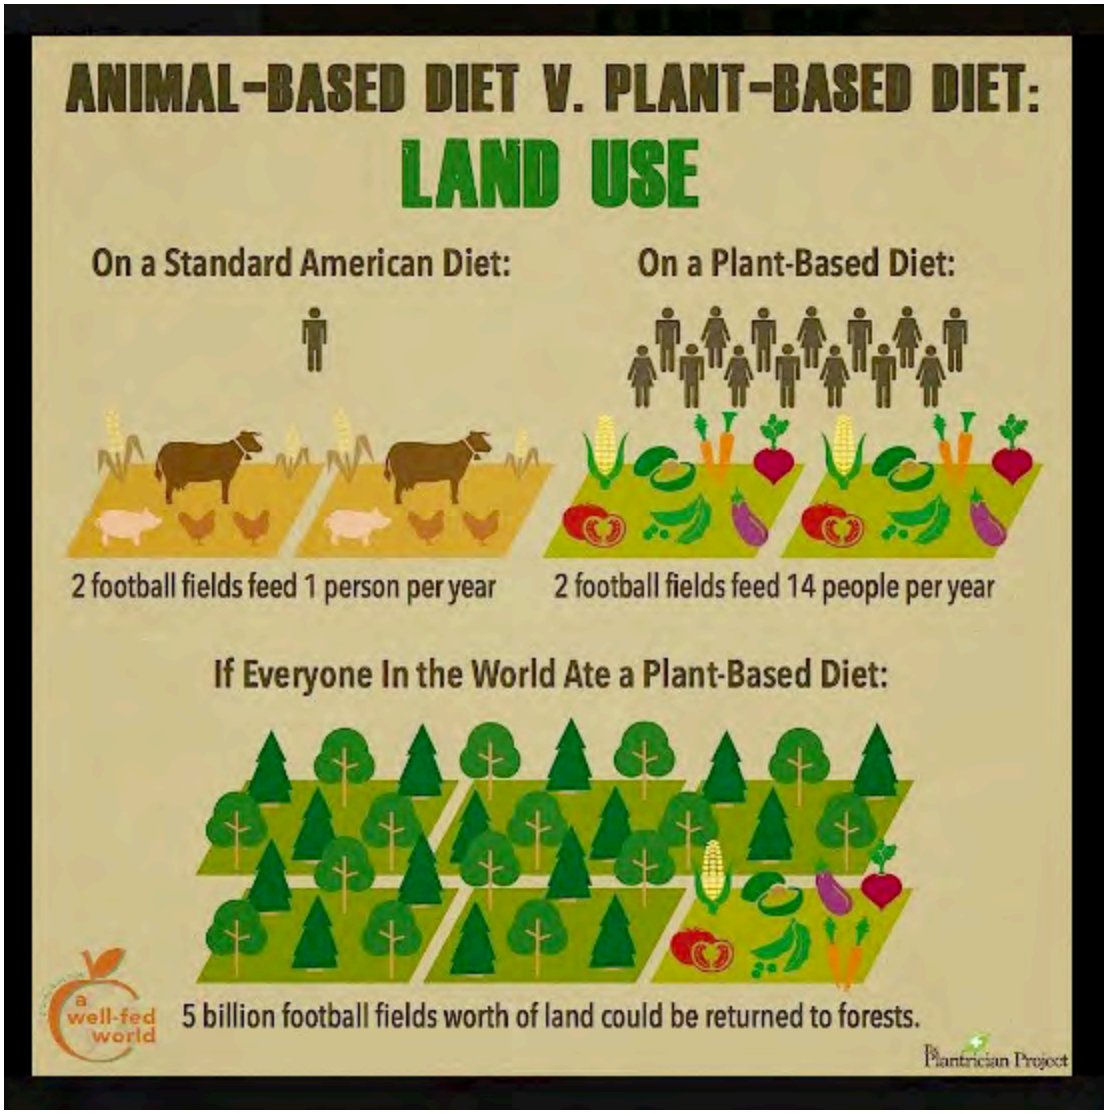

effluents and dumping

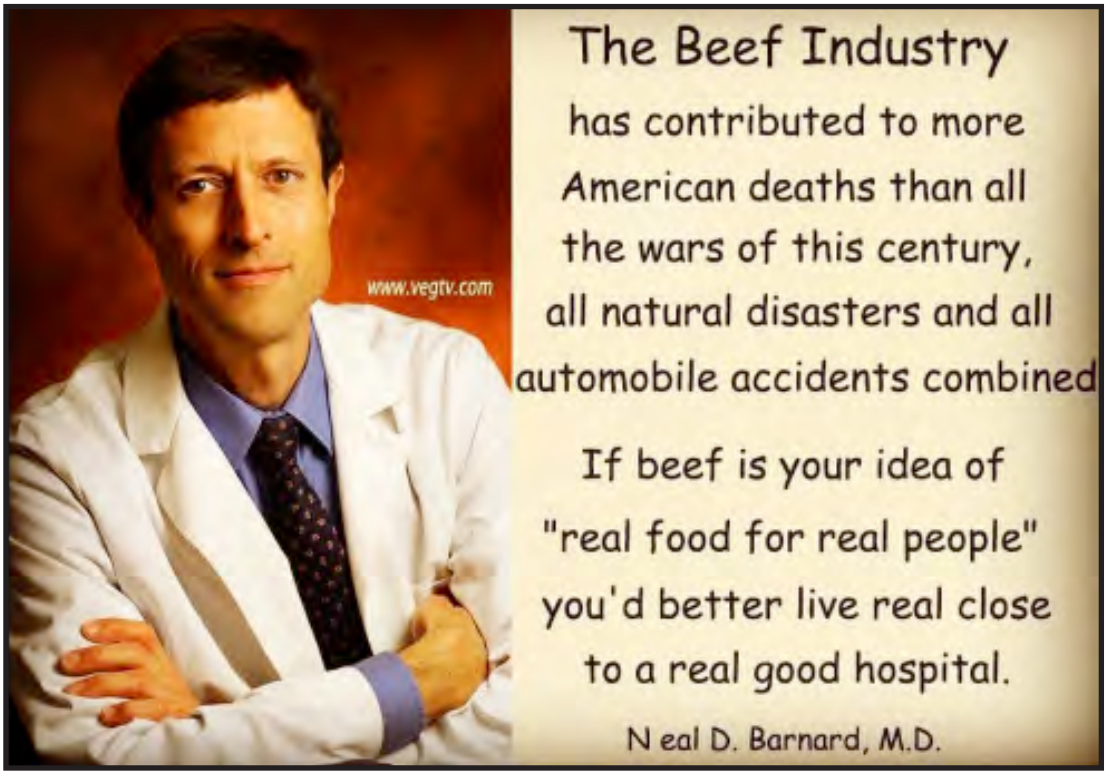

- Drastic fish depopulation of the world's 17 major fishing areas by way of over-fishing
- Pollution of natural resources from animal feedlot and factory farming and slaughter-house wastes
- Great suffering by farmed animals
- Pollution of lands and oceans with plastic packaging for food products, and deadly harm to those animals that ingest the detritus
- Pollution of natural resources from medical waste products
- Loss of topsoil from over-farming, cropland stripping, tilling and livestock trampling, causing land erosion, flooding and atmospheric dust
- Denudation of forests, prairies and fields, causing indigenous species habitat losses, biodiversity losses, food chain imbalances, atmospheric temperature increases by way of reflected sunlight, contributing to global climate change, glacier and polar icecap melting, rising sea levels, dust storms, droughts and increasing forest fires
- Increased atmospheric greenhouse and noxious gasses by way of cooking
- Increased atmospheric warming by way of clearing fields for farming by burning, and post-harvest field and farm waste burning
- Increased atmospheric greenhouse and noxious gasses by way of livestock flatulence, urine and feces
- Atmospheric pollution from farm equipment and product distribution fuel combustion
- Fuel combustion emissions, fuel spills, and fuel tank leakage of farm equipment produce transportation vehicles
- Pollutant generation from the mining and production of fertilizers and the production of farming chemicals

Here's How America Uses Its Land by Dave Merrill and Lauren Leatherby, July 31, 2018
https://www.bloomberg.com/graphics/2018-us-land-use/

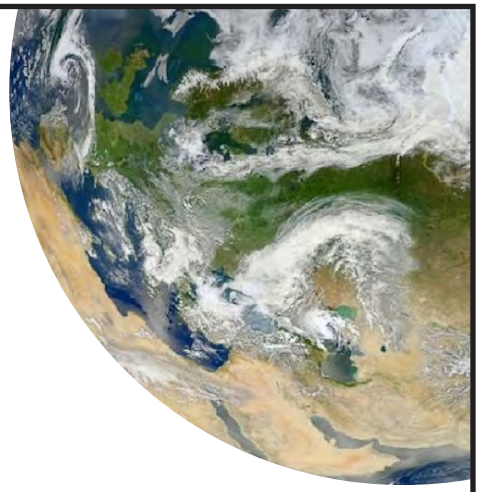

ANIMAL-BASED DIET V. PLANT-BASED DIET:
LAND USE
On a Standard American Diet:
On a Plant-Based Diet:
2 football fields feed 1 person per year
2 football fields feed 14 people per year
If Everyone In the World Ate a Plant-Based Diet:
a well-fed world
5 billion football fields worth of land could be returned to forests.
Plantrician Project

The Beef Industry
has contributed to more
American deaths than all
the wars of this century,
all natural disasters and all
automobile accidents combined
If beef is your idea of
"real food for real people"
you'd better live real close
to a real good hospital.
N eal D. Barnard, M.D.

Of the less than 1 percent of freshwater available for human use, a whopping 70 percent goes toward growing food and raising animals. Your diet is probably the biggest slice of your water footprint, especially if you eat meat from cows and other animals fed with water-intensive crops, such as corn. The average U.S. diet currently takes 1,320 gallons (4,997 liters) of water a day to produce. -NationalGeographic.com

3 PRIMARY GASES ARE RESPONSIBLE FOR GLOBAL CLIMATE CHANGE .....

Carbon Dioxide

- If one person exchanges a petro-fueled car for a hybrid, carbon dioxide emissions will be reduced by 1 ton per year.
- If one person changes from a meat-based diet to a vegan diet, carbon dioxide emissions will be reduced by 1.5 tons per year.
- If every American dropped one serving of chicken per week, this will be equivalent to taking 500,000 petro-fueled cars off the road.

Methane

- Chickens, turkeys, cows and pigs are collectively the largest producers of methane in the U.S.
- Methane is a 20X more powerful heat trapper in the Earth's atmosphere than is carbon dioxide.

Nitrous Oxide

- The meat, egg and dairy industries produce 65% of worldwide nitrous oxide emissions.
- Nitrous oxide is a 300X more powerful heat trapper in the Earth's atmosphere than is carbon dioxide.

DIETARY IMPACTS .....

Greenhouse Gas Emissions

- One calorie of animal protein requires 11X more fossil fuel than does one calorie of plant protein.
- A meat-based diet creates 7X the greenhouse gases as does a conventional cooked vegan diet.
- Fruiticulture removes excess greenhouse gases.

Water Consumption

- It takes about 2,400 gallons of water to produce 1 pound of meat (1,000 calories).
- It takes about 250 gallons of water to produce 2.5 pounds of bananas (1,000 calories).

FI FRUITICULTURE INSTITUTE

Impacts of Conventional Diets on Human Bodies

- Endocrine disruption, neurological damage, infertility, mother's milk contamination, degeneration of tissues and organs, and a host of diseases from A to Z, resulting in pain, great suffering, accelerated aging, and reduction of lifespan
- Acidification (acidosis) and weakening from eating an excessive percentage of acidifying foods, such as meat, eggs, dairy products, wheat, rice and beans
- Pesticide, fungicide, herbicide and fertilizer residues in drinking water and on and in foods
- Toxification from cooking-generated chemical byproducts
- Impairment of the respiratory system and heart from the inhalation of cooking fumes and particulates
- Corruption/perversion of our taste buds
- Malnutrition/nutrient deficiencies by way of the destructive effects of cooking and other processing of foods
- Reduction of mental capacity and cognitive ability, befogging and distortion of thinking, and impairment of mental health
- Dulling of the senses
- Reduction of energy, vitality and healing ability
- Decline of physical performance
- Stunted growth
- Generation of body odors
- Defilement of our natural beauty
- Hair loss
- Dental decay
- Sterility and infertility
- Degenerative gene mutations, heredity of defective genes, and birth defects

Impacts of Conventional Diets on Human Behavior

- Overstimulation of sex drive, begetting overpopulation
- Mindless exploitation and defilement of all natural resources
- Overeating
- Anorexia
- Addiction to excitotoxin foodstuffs
- Addiction to depressant foodstuffs
- Addiction to junk foods
- Dependency on and abuse of drugs
- Dulling of vital expressions
- Self-loathing
- Shame
- Depression
- Frustration
- Anxiety
- Loss of empathy
- Anger/hostility
- Crime
- Hunting, abuse and slaughter of animals
- Murder
- Acceptance of / condoning the killing of animals and humans
- Acculturation to wars
- Great suffering
- Suicide

Alarm Bells Are Ringing — Right Action Is Needed Now!

Is all that not shocking and cause for massive eco-positive action? Isn't it time to finally heed Rachel Carson's year 1962 warnings? Please read on...

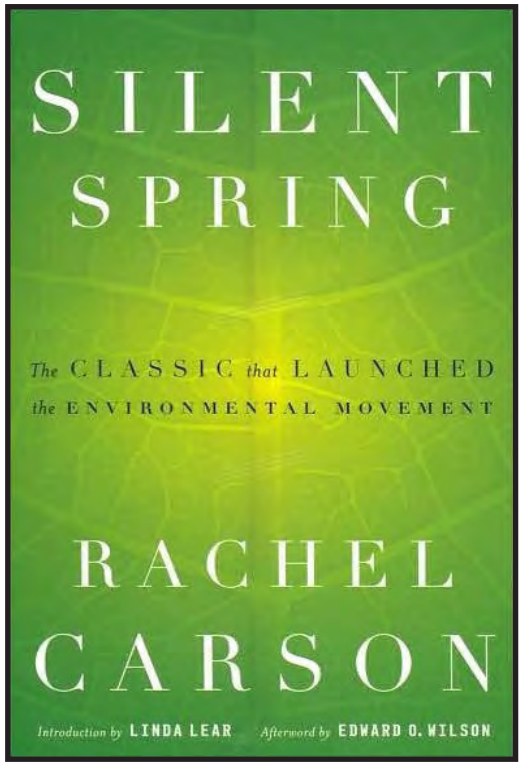

"We stand now where two roads diverge. But unlike the roads in Robert Frost's familiar poem, they are not equally fair. The road we have long been traveling is deceptively easy, a smooth superhighway on which we progress with great speed, but at its end lies disaster. The other fork of the road—the one less traveled—offers our last, our only chance to reach a destination that assures the preservation of the earth."

-Rachel Carson, M.S., Silent Spring, 1962

"There is hope if people will begin to awaken that spiritual part of themselves, that heartfelt knowledge that we are caretakers of this planet."

-Brooke Medicine Eagle

Rebalancing the Atmosphere by Rebuilding Soil Carbon

by Center for Food Safety

www.centerforfoodsafety.org

Extracted from "REGENERATING PARADISE – Rebuilding Soil Carbon in Hawai'i"
Center for Food Safety, 2018
https://www.centerforfoodsafety.org/files/regeneratingparadise_25317.pdf

The Challenge

Currently, an excess of carbon dioxide (CO_2) currently exists in the Earth's atmosphere, which is warming the planet, acidifying our oceans, and increasing the frequency and severity of extreme weather events. These changes to our climate, resulting from high concentrations of atmospheric CO_2, are harming ecosystems and threatening our means of food production.

The Opportunity

Thankfully, the resources necessary to address this challenge are within reach. Healthy soil captures and stores vast amounts of carbon. When managed with sustainable farming practices, soil can serve as a valuable tool in combatting climate change, by pulling carbon out of the atmosphere and storing it in the ground beneath our feet—a process called carbon sequestration. Soil carbon sequestration reduces the atmospheric concentration of CO_2, while supporting a more sustainable food production system and offers a risk-free, systemic solution.

The Carbon Cycle

Carbon is the building block of life and it's constantly cycling in between the land, ocean and atmosphere in various states—liquid, solid, and gas. Human activities have radically altered the natural cycling of carbon, creating an imbalance in the system. Centuries of land use changes, extractive farming practices, and, the burning of fossil fuels for en-

ergy, have removed solid carbon from the earth and released it as CO_2, a gas, into the atmosphere.

While it is difficult to measure exactly how much carbon has been lost from our soils globally, an additional 292 billion tons have been added to the atmosphere through the burning of fossil fuels.

Once in the atmosphere, CO_2 acts as a greenhouse gas, allowing sun to pass through on its way to the Earth's surface, but trapping the heat that bounces back. An increase in the concentration of CO_2 in the atmosphere means that more heat is being trapped, leading to a rise in the Earth's average temperature and an imbalance in the global climate system.

Project Drawdown estimates that by 2050, regenerative agriculture will increase from the current 108 million acres to 1 billion, resulting in a total reduction of 23.2 gigatons of carbon dioxide from both sequestration and reduced emissions.

The Basics of Carbon Sequestration

Carbon sequestration involves removing CO_2 from the atmosphere naturally and storing it instead in soil and plants. This transformation requires photosynthesis, a process in which plants convert sunlight, water, and CO_2 into carbohydrates. Some of these energy-rich molecules are then used by the plants to fuel growth, but as much as 40% of the CO_2 captured is released through the plants' roots to feed the soil microbes below.

Soil microorganisms transform these carbon resources, resulting in a complex mixture of plant and microbial biochemical compounds in various stages of decomposition. Soil organic carbon can persist in the soil for decades or millennia when physically protected in soil aggregates and chemically protected by soil minerals.

Carbon sequestration serves multiple purposes, including mitigating climate change and improving the health and biodiversity of our global soils, which allows for higher agricultural yields. Healthy, carbon-rich soils are also directly tied to fresh water availability and create greater resilience in the face of droughts and floods.

By implementing agricultural practices that actively encourage carbon sequestration, we can begin to transform our soils and put carbon back into the land where it is needed most.

Regenerative Agricultural Practices

Soils are dynamic. They can act as a source or sink of carbon, depending on how they are managed. The conversion of native grasslands to cropland, wide-scale deforestation, and practices that leave soil uncovered and exposed to the elements, encourage soil to act as a source of carbon, releasing it as CO_2 into the atmosphere. Regenerative agricultural practices do just the opposite, fostering soil's natural role as a carbon sink and enabling it to store carbon in a stable, solid form. Here are some common regenerative practices.

Cover Crops - The practice of planting and maintaining crops that return nutrients to the soil and are typically not harvested, in order to avoid bare soil

- Suppresses weed growth and common crop diseases
- Lowers soil temperatures during hot weather
- Improves soil fertility
- Reduces soil erosion
- Provides habitat for beneficial organisms

Perennial Plants - The practice of selecting and planting perennial crop varietals, which are better able to capture and store carbon than their annual counterparts

- Increases soil's ability to capture and store carbon
- Extensive root networks protect against soil erosion and runoff
- Lowers annual labor and input costs
- Improves soil structure and nutrient content
- Increases soil's water storage capacity

Mulching - The practice of leaving crop remains after harvest in food forests and orchards to decompose, rather than clearing them from the land

- Improves soil fertility
- Increases nutrient availability
- Increases soil biological activity and fertility
- Reduces soil erosion
- Moderates soil temperature
- Suppresses weed growth
- Feeds beneficial bacteria and fungi that facilitate soil carbon sequestration

Composting - The practice of collecting organic waste, such as food scraps, yard and farm trimmings and other plant waste materials, and allowing them to decompose and transform into a nutrient-rich agricultural input

- Reduces greenhouse gas emissions from landfills
- Increases nutrient content of soil
- Improves soil's ability to retain water
- Increases agricultural yields
- Feeds beneficial bacteria and fungi that facilitate soil carbon sequestration

Crop Rotation - The practice of growing different crops on the same land in succession, in order to preserve a balance of nutrients in the soil and enhance ecosystem processes.

- Reduces the prevalence of early-season pests and damage from these insects
- Improves productivity of rotation crops
- Reduces the need for synthetic inputs and chemicals
- Improves water quality
- May increase farmers' profits, due to lower input costs and higher yields

Dr. David Klein's editorial addition:

Fruitcentric Agroforestry - The practice of integrating fruit trees, fruiting vines and bushes, vegetables, herbs, shrubs, ornamentals and flowers in crop production

- Provides additional habitat for beneficial organisms
- Decreases atmospheric CO_2 concentration and increases oxygen content
- Reduces soil erosion
- Improves health and stability of soil
- Improves soil's ability to retain water
- Increases crop yields

Regenerative-Biological Agriculture

by Gerry Ross, Ph.D.

www.kupaafarms.org

"Organic farmers and organic farming
are the answer to climate change."
-Dr. Gerry Ross

Currently, modern conventional agriculture is a major source of greenhouse gases. It has caused dramatic losses of topsoil and contamination of freshwater and marine water bodies through unmitigated agricultural runoff. Additionally, agriculture faces a daunting task of feeding a growing population on a static or shrinking base of arable land.

The philosophy of Earth system science examines cross-disciplinary interconnections of our planet from a holistic perspective in much the same way that permaculture approaches agriculture. Applying these holistic concepts to agriculture reveals important lessons that can help address key elements of human survival by utilizing and building on the strength of the soil ecosystem, i.e., Regenerative-Biological Agriculture.

The soil ecosystem is an under-explored aspect of modern agriculture but has evolved with plants since their emergence from the oceanic realm more than 400 million years ago. Regenerative-Biological Agriculture can be a powerful ally in the "more with less" challenge. Examples include drought resistance and enhanced mineral availability by culturing symbiotic soil fungus, using nitrogen fixing microbes to decrease our reliance on chemical fertilizers, and enhanced resistance to soil erosion through soil particle aggregation, a byproduct of a healthy soil ecosystem. Perhaps the greatest opportunity of widespread application of Regenerative-Biological Agriculture will be sequestration of atmospheric carbon dioxide in the form of organic matter (humus) such that properly stewarded agricultural lands

represent our best bet to rescue our planet from the brink of climate damage.

A most optimistic perspective on the role of Regenerative-Biological Agriculture is offered by the Rodale Institute: "... climate change has provided an unparalleled opportunity to harness cutting-edge technologic understanding, human ingenuity and the rich history of farmers working in tandem with the wisdom of natural systems to arrive at a stable climate by way of healing our land and ourselves. Let's get going." For more information, please visit:
http://rodaleinstitute.org/regenerative-organic-agriculture-and-climate-change/.

Whole Life Systems Depend on Healthy Soil

by Don Weaver

It was during 1977, while spending a year studying Ecology and Natural Agriculture and Whole Life Systems at Farallones Institute in Northern California, that I first discovered the thinking and writings of engineer-farmer-ecologist John D. Hamaker, while reading through the back issues of *Acres, U. S. A.* ("A Voice for Eco-Agriculture"). My initial impression was "here is a remarkably brilliant, unique and fascinating human being with some very important things to say!" All these years later I think there was no one more intelligent as an "ecological thinker" on this planet, nor one with more to contribute to human and biospheric health and survival. (Taking nothing away from the huge contributions of Bill Mollison, Richard St. Barbe-Baker and others, of course).

One of the first John Hamaker articles I read began as follows:

"This study is about some of the basic laws of nature to which we must conform. Those who see the human race as masters of nature invite death on a massive scale. Those who see nature as a code of laws superior to any man-made law can look forward to a quality of life which is almost unbelievable from the perspective of an economy of scarcity subsisting in a wasted land.

The land is wasted because it has lost its fertility. Organic matter is not fertility in itself but is only a rough measure of fertility. Organic matter is made up of the residues of dead plants and microorganisms. Dead plants, as such, provide no fertility. Soil fertility is protoplasm—

the substance inside the cellular walls of microorganisms. The microorganisms can be fresh, in which case the protoplasm is available fertility. Or the microorganisms can be dehydrated, in which case the protoplasm is not available but constitutes the bank of fertility. The cycle of life is really the story of the travels of the protoplasm as it goes from microorganisms to the life above the soil and back into the soil again.

Microorganisms produce the protoplasm of all living things. Microorganisms themselves feed on the total mixture of minerals and gases in the biosphere and are energized by carbon. We can build enormous per acre tonnages of protoplasm into the soil in a very short time—enough so that sun energy reaching the plant becomes the limit of growth. The foods of microorganisms are the cheapest raw materials on earth." ("The Second American Revolution," Part I, Acres U. S. A., April 1974)

As one already very excited about optimum nutrition and health for all living things, hopeful that humanity could still find and implement the ways of living which would make possible the regeneration of itself and the Earth, and committed to helping however I could, this fellow Hamaker was striking some deep chords in me. The more I read, the more I realized that his messages were designed to strongly influence not only my own life, but probably everyone else's. Soon I read his four-part series in *Acres, U. S. A.* entitled, "Life or Death—Yours", which had this conclusion:

"Everything in this world is connected to everything else. Nothing is more connected than the earth's tectonic system and the life on the surface of the earth. The tectonic system, by gravitational separation in the heaters, brings up to the top the lighter weight elements, both solid and gaseous, which are useful to life as catalysts and components of the living protoplasm. In turn, the microorganisms have functions to perform in establishing and maintaining the correct balance of elements so they can survive. And finally, man is given the same option of performing a function in the life support system or die. Right now the change in the weather is carrying the message of death. Unless the human race wants to be reduced to the few primitive survivors who came out of the equatorial region after the last glacial period, it had better get to work." (*Acres, U. S. A.*, October 1976)

Then and now I put great value on both an open mind concerned with discovery of truth, and on having a "healthy skepticism." Thus, personally, as Hamaker's ideas and

inquiries and insights on ecological and climatic changes expanded and evolved, I had no choice but to "read on"—as well as initiate a correspondence which has led to the exchange of hundreds of letters and telephone calls, and three visits to the Hamaker farm and (former) residence in Potterville, Michigan. It was on my third visit, after having given a presentation at the First Global Conference on the Future in Toronto, entitled "Worldwide Starvation by 1990" (after a Hamaker paper), and being convinced by that time that Hamaker's fundamental insights were correct, that I agreed to help write and publish *The Survival of Civilization*. It was finally published in April 1982. We sold and gave away 14,000 copies of the print editions, and thousands of *Solar or Ice Age? Bulletins* have gone out to people worldwide. John Hamaker passed away in 1994.

For those concerned with total planetary health, and who've not read *The Survival of Civilization* by John Hamaker and myself, here is a concise summary listing TSOC's primary messages; all of which are supported by strong evidence from studies in many disciplines, from soil science to climatology through the whole study of ecology of the last three million years known as Quaternary research. The remarkable ability of John Hamaker's mind to produce a synthesis of many diverse facts and principles has produced major breakthroughs in understanding.

1. The fertility of the Earth's soils can be restored to high levels by remineralizing them, which means feeding the soil organisms the complete spectrum of mineral elements found in natural gravels and other rock mixtures found all over the world. The finer this material the better for rapid proliferation of all soil organisms and plant life nourished by them. Fine dusts containing all the biologically essential minerals produce bountiful crops and macroorganisms full of health and vitality.

2. Human health on all levels is greatly dependent on the quantity and balance of available soil minerals and resultant food quality.

3. Planet Earth is a living planet characterized by the procession of cycles within cycles... within cycles. Think of the cycles of the leaf and the elements composing it, as the cycles of days and seasons forms, transforms, and re-forms them in the annual/perennial work of re-creating a green biosphere. For at least the prior 2.5 million years of this Quaternary Period, the major climatic biosphere-controlling (and biosphere-controlled!) cycle has been the approximately 100,000-year cycle of alternating glacial and inter-

glacial periods. Twenty-five of these cycles have passed over the last 2.5 million years, each one about 90,000 years of glaciation followed by about 10,000 years of interglacial conditions.

4. Glaciation functions to mix and grind up and spread out over the Earth many trillions of tons of mixed rocks or glacial till—from boulders to fine dust which powerful glacial meltwater and wind systems carry up to thousands of miles, remineralizing the soil-life systems which became demineralized through the course of the 10,000 year interglacial. Intensified volcanism during glaciation, associated with the transfer of tremendous weight from oceans to glaciers, assists the remineralization job. Broadly speaking, the first 5,000 years of the interglacials are the times of vast recolonization and flourishment under renewed soil and climatic conditions—a time of practically universal fertility and health and abundance—and the last 5000 years are times of increasing soil demineralization/acidification. This results in progressive decline of fertility and health, naturally accompanied by the spread of deserts; the die-out of forest due to soil impoverishment, insect/disease predation, burning, increasing climatic stresses; and thus the collapse of the carbon cycle, allowing the carbon dioxide (CO_2) content of the atmosphere to build higher and higher. Glaciation always follows this planetary imbalancing process. What does this tell us about the true "greenhouse effect" of CO_2 (and related gases) build-up at the end of an interglacial period—as is occurring now?

5. Our present world is about 10,800 years into the current interglacial period. We are due for glaciation, and our biosphere-destroying and CO_2-releasing "ways of life" are rapidly intensifying the process by which ecological systems break down and the climatic system gears up for 90,000 years of glaciation: mineral-and-carbon cycle collapse causing CO_2 build-up, hence an accentuated heat-trapping system ("greenhouse effect") required to begin producing the vast quantities of evaporated water needed to increase cloud coverage/albedo/snow-and-ice build-up of the upper latitudes. Increasing temperature and pressure differentials between overheating lower latitudes and cooler higher latitudes steps up overall atmospheric circulation and carries more of the evaporated water to the regions of glaciation, bringing drought to lower latitudes, and worsening all climatic extremes in between. Eventually the glacial process creates ice sheets over vast areas—up to one mile thick and more—and drops sea level about 400 feet!

6. In 1979, Belgian palynologist (palynology is pollen study) Genevieve Woillard gave a

priceless gift to the world —or at least to the "scientific community" as it is called—by publishing in *Nature* (October 18, 1979) the results of her years of work studying lake deposits in France. The work showed that the vegetation and climate changes at the termination of the last interglacial period were very rapid: trees requiring good soil and temperate conditions steadily died out over the last 150 years, with a complete, dramatic change to sub-arctic type vegetation adapted to poorer acidified soils coming on in a final 20-year period. The interglacial period of about 10,000 years was over. Unfortunately, "the scientific community" has done little since then to make public Woillard's crucial findings; instead, it has focused on limited mathematical computer modeling.

7. Human exploitation and lack of generosity toward the soil-life system and whole biosphere has accelerated the natural reglaciation timetable by probably about 500 years. Based on increasing acidity of precipitation caused by increasing volcanism and burning of vegetation as well as industrial pollution, on accelerating demineralization of soils and the rise of the CO_2 curve, and on the rate of climatic deterioration worldwide, John Hamaker estimated that we were deep into another interglacial transition period.

8. Glaciation is—or, at least, has been up to now during this Quaternary Period—Nature's way of regenerating the health and fertility of the biosphere. In other words, the grinding and spreading of vast quantities of the mixed mineral-bearing rocks of the Earth's crust is Nature's way of regenerating the health and fertility of the biosphere. Now Nature-on-Earth, or "Gaia," has a nervous system/brain of great potential intelligence composed of about seven billion cells, collectively known as "wise man" (female or male) or Homo sapiens. You are one of those cells! Do you see-hear-feel-sense-understand-know a need for Earth regeneration? If so, how will you, with your more or less intimate connections with all seven billion fellow wisdom-harboring cells, respond?

9. We can remineralize and reforest and re-green and regenerate the soils and biosphere to the extent where health and abundance become the norm and the people-inclusive "Gaiasphere" is enabled to bring the CO_2 level back down to normal interglacial levels of around 270 ppm (from about 407 ppm in 2018), a most critical part of an overall restoration of "the Balance of Nature." We can if we can recognize and accept the responsibility to do so, and if we still have time before the glacial process proceeds beyond a point of

no return and our last opportunity to re-create an ecologically and socially harmonious world is lost, perhaps forever.

Soil Remineralization

by Don Weaver

Our planetary soils have become severely eroded and thus demineralized over thousands of years. Plants require a continuous intake of minerals, just as we do; they need calcium to build structural support, iron to carry oxygen, zinc for reproductive health etc. Plants growing on mineral-depleted soil do not get enough nourishment and, thus, are to some degree devitalized and more vulnerable to their insect, worm and fungi predators.

Remineralization encourages greatly increased growth of soil microorganisms and the assimilation of nutrients, leading to high quality, flavorful crops. It also counteracts acidity and erosion, increasing the storage capacity of the soil, contributing to the building of humus complexes and, when sprayed on plants, repels both fungi and insects. As well, plants and trees become highly resistant to frost, drought and all devitalizing influences.

Adding rock dust to your compost pile also enhances composting benefits and is another excellent way to remineralize soils.

Rock dust is finely ground rock, often as fine as talcum powder, typically passing a 200 mesh screen. A broad variety of rocks, as found in most river and glacial gravels, generally ensures that a natural balance of all the 30+ biologically-essential mineral elements are provided for health. These naturally mixed gravels can provide all 92 elements of the Earth's crust.

Summa Minerals rock powder/dust

Rock powder/dust products

To purchase rock dust, try your local nursery or garden supply store, requesting they carry it if it is not in stock. You can help them find the most practical suppliers for your region by using the worldwide Resources listing at http://www.remineralize.org. A 50-pound bag of rock dust typically costs about $25, with quantity discounts available. Bulk purchases with fellow growers may be wise.

Rock powder should be as finely ground as possible to encourage the growth of tiny soil microorganisms and earthworms and, thus, soil fertility. Microorganisms secrete acids and enzymes to digest the inorganic rock minerals and build their organic protoplasm, in turn creating organic soil matter. They "feed at the first table" (as stated by Professor William Albrecht), transforming the soil components into readily assimilatable "plant food." As such, they are the first link in the food chain for all planetary life. They also need organic matter, such as your homemade compost, water and the atmospheric gases of carbon, nitrogen, sulfur, etc.

For better plant health at home, add a couple of tablespoons of rock dust to houseplants or other potted plants. To grow mineralized, organic produce in your garden, apply 1/4 pound to 1 pound per square foot of planting area. This is a generous rate of about 5 tons to 20 tons per acre. Also, incorporate rock dust throughout your compost heap for a superior finished product.

When planting fruit and nut tree orchards, add 10 to 20 pounds of rock dust to the soil surrounding new tree root zones (including throughout the planting hole), spreading the dust out to the drip line and beyond. Mature trees and sick trees will especially appreciate 50 pounds or more. While rock dust is great for the soil and plants, you should,

of course, avoid breathing it and use a protective mask.

The Link to Climate

Records show that there have been 25 or more Ice Age cycles, each lasting approximately 90,000 years, followed by a temperate period, such as ours, of approximately 10,000 years. Glaciers advance and recede in many cycles during each recurrent Ice Age. This action grinds down the rocks in the glaciers' paths, yielding mineral-rich dust which, along with mineral-rich volcanic rock dust, is distributed by glaciers, water, and wind far over the surface of the Earth, remineralizing soils and enhancing plant life.

It has been established that the Earth's soil becomes progressively demineralized during each lush, warm interglacial period. This has major global consequences—primarily, a decline of the world's forests and other vegetation. This in turn causes a release of carbon dioxide into the atmosphere, exceeding the available sinks for the collection of greenhouse gases, thus trapping excess heat from the sun and dramatically altering the world's climate. We have seen the level of carbon dioxide in the Earth's atmosphere rise exponentially over the past century, while global weather patterns have become more and more extreme.

Hamaker's research on soil demineralization and CO_2 at last explains the reasons for the recurring 90,000-year glacial periods following each 10,000-year warm period. His research indicated that CO_2 released from soil demineralization and consequent forest dieback and burning intensifies the greenhouse effect.

The greenhouse effect occurs primarily in the tropics, which get the most sunshine, rather than in the polar regions, which get very little sunshine. When the temperature differential between the tropics and the poles increases, there is a resultant cycle of fierce wind systems, hurricanes, tornadoes and other violent storms. (Sound familiar?) More of the moisture gathered by these increasing storm systems is transported to the higher latitudes where it is deposited as snow and ice, eventually inducing a new glacial cycle.

Thus, we can understand the paradox in Hamaker's theory of how global warming can trigger the next Ice Age. Our agricultural and deforestation practices, fossil fuel burning and overpopulation all contribute to and accelerate the climatic shift process.

In light of this and the historical evidence that we are at the end of a 10,000-year inter-

glacial period, it would be prudent to wake up to the far-reaching and potentially tragic implications of this. The current man-made "climate chaos" which is costing upwards of $100 billion each year in economic damages alone will most likely steadily worsen. The global toll of devastation should inspire us—or could force us—to wake up to our planetary responsibilities of remineralizing and regenerating the Earth today.

Evidence supporting most of Hamaker's thesis has mounted in recent years, as shown by record snow cover in parts of the northern hemisphere and a shortening of the growing season by weeks in some locations. Insects, disease and fire are devastating forests at record levels worldwide. Hamaker first estimated in 1976 that within a few decades the growing season could decrease to the point that millions of people will starve, and this applies to the currently affluent countries as well. Unfortunately, there is now much evidence for the truth of his predictions. Clearly, no nation or world can be truly rich without rich, productive soil and healthful foods as its foundation.

Reviving Dying Forests

There have been stunning results from the remineralization of forests suffering from acid rain, soil erosion and general disease. Here are some examples from the Research section at http://remineralize.org:

• "A 1986 report on long-term experiments in central Europe by the Bavarian Research and Experimental Institute of Forestry in Munich, Germany showed that in one forest, 24 years after pine seedlings were remineralized, the wood volume was four times higher than in the untreated area."

• "The results of Dr. Robert Bruck's experimental remineralization trials of a dying forest on Mt. Mitchell near Asheville, North Carolina showed that 12 weeks after the application of rock dust, the height of red spruce was increased by 27% over non-treated controls, and the height of Fraser fir was 19% greater than the untreated controls."

• "The Men of Trees organization in Australia (www.trilliontrees.org.au) performed remineralization trials on many species of trees in Australia with phenomenal results. For example, compared to untreated controls, trees grown from eucalyptus seedlings in remineralized soil grew five times faster."

• "The Sudden Oak Life organization website (www.suddenoaklife.org) displays photos

of some of the thousands of 'fatally sick' trees that have recovered through remineralization. Orthodox forestry still appears to be stuck on the 'no cure—use chemicals' mentality in treating such disease."

Remineralization of the world's soils and forests will propagate carbon sinks which absorb CO_2 from the atmosphere and contribute to climatic stability. A return to normal interglacial CO_2 levels of about 280 ppm, rather than the current 408+ ppm, is quite possible and probably essential to our survival. By accepting the great task of remineralizing the Earth's soils (much as the glaciers do during an Ice Age), we can create fertile soil and sustainable abundance for all to share. We must also plant many billions of new trees, including fruit and nut varieties, and convert farms and gardens to the organic, mineralized approach. Using our great intelligence and compassion in giving back to the Earth, we can restore human health and sanity and create a new Eden.

The Nutritional Aspect

When we eat food grown on depleted soil we, like the plants, become more susceptible to disease. All degenerative diseases have been on the rise in America in recent decades. Dietary fat, cholesterol, salt, overly-refined and pesticide-contaminated foods are obvious culprits, but a serious deficiency of minerals in our food is a frequent contributing factor. Mineral-depleted soil has been directly correlated with increased death rates. Laboratory studies have shown that trace mineral deficiencies are associated with an increased risk of cancer. Even one trace mineral deficiency carries this risk. Vibrant health depends upon a broad spectrum of all the minerals essential to human health.

"The rock is the mother of the soil," is how one geologist in the 1800s put it. Since the most fertile soils usually have a variety of types of "parent rocks", it seems wise to try to duplicate the natural processes when we remineralize.

The Hunza Valley soils have grown some of the best crops of fruits, vegetables and people for centuries. The Hunzas irrigate their crops two or more times a year with the Ultar Glacier meltwater which contains glacial gravel dust, treasured as "glacial milk." Glacial action has produced much of the Earth's fertility, as glacier's crushing mass grinds and mixes together rocks of broad variety and element content. Some volcanically-derived soils, such as those in Java, can also be very fertile, although it is areas like Hunza and also Vilcabamba where glacial and alluvial (river-carried) soils have nourished the leg-

endary longevity of the people there.

According to E. B. Szekely in *The Ecological Health Garden*, the Essenes may have been the first health-conscious people to pulverize rocks to add to their composts, gardens and orchards around 2000 years ago. Having little in the way of volcanic and glacial deposits or perhaps even silt-rich rivers in the Dead Sea region, they apparently found a way to create rock dust without the kind of machinery we now have.

After J. I. Rodale, founder of *Organic Gardening* magazine, visited Hunza in the 1940s, he wrote *The Healthy Hunzas*, which included a chapter on rock powder. He urged that we learn from the Hunza's great example and grind up the billions of tons of rock needed to remineralize the soils in our country. Today, there is an abundance of rock powder which is available as a byproduct of the aggregate and stone industries. For those of us who are backyard organic gardeners, it is most fortunate that more and more gardening outlets are carrying bagged rock powder for us to take home and add to our compost and orchards and gardens.

Here is how soil remineralization works. Rock dust feeds the soil workers, i.e., the worms and soil microbes, the essential minerals they require to build their protoplasm and enzymes, and the mineralized microbes are digested by the plant roots to nourish the plants. If we desire mineral-rich living foods, then we need to ensure that we or those who grow our food have provided these soil workers their complete natural diet of organic compost or mulch and rock minerals. If you can do this in your own garden and orchard and eat fresh, living, mineralized foods, you can give thanks because you are living in Paradise!

Not quite? The air is sick, the water is in trouble, the forests are on the way out, and weather and climate are changing, you say? Perhaps you are right and our little island of Paradise isn't the Paradise we know the Earth is meant to be. However, garden and orchard remineralization is something most of us can do, and this is a great way to reverse the degenerative spiral toward Paradise Lost and show our fellows a glimpse of how near Paradise Restored can really be.

Never underestimate the power of an enzyme! Or the spirit of love when given to Mother Nature and her human children. A taste of real super-delicious living food from rich mineralized soil is one way to offer that Paradise glimpse, and there are few things

more inspiring and soul-nourishing than a garden and orchard in bloom and fruition.

Enhancing Agriculture

The best source of soil minerals is the fine powder of common crushed gravel (mixed rock). In 1976 John Hamaker (1914-1994) spread gravel crusher screenings on part of his ten-acre farm in Michigan in an area of sparse rainfalls and dry summers, with no irrigation. The following year, his corn produced 65 bushels per acre. In comparison, neighboring farms yielded less than 25 bushes of corn per acre.

Don Weaver adding rock powder to a new tree well

Moreover, independent analyses showed that Hamaker's corn contained 28% more protein, 47% more calcium, 57% more phosphorus, 60% more magnesium and 90% more potassium than the same type of corn grown with chemical fertilizers nearby.

Over forty years ago, published studies by the USDA showed that the application of cement kiln dust (a less satisfactory source of minerals) also produced better crops, but the researchers did not follow up on this as they could not ascertain what it was in the dust that effected such results.

Hamaker estimated that on fully remineralized soil, American agriculture could grow four times as much food as is possible now, or the same amount of food at about one-fourth the cost, sans pesticides or chemical fertilizers.

The Most Ecologically Positive Diet: How the Raw-Fruitarian Diet Can Regenerate the Earth

by Don Weaver

A serious condition of human-environment imbalance existed when Earth Day began in 1970, because most of the world's four billion inhabitants lacked understanding of our interconnected planetary life-support systems. Forty-eight years of ecological education later, we've learned much about the effect of our actions on the Biosphere, yet a majority of now 7.3 billion continue living in ecologically unhealthful and destructive ways. Is this rational? Enlightened? Natural to our species, Homo sapiens (which means "Wise man")? I say NO!

We're now taking about 120% of what the biosphere produces annually. Before we push irreversibly beyond Earth's ecological capacity to support us and 10-30 million other species, let's explore what we can do to transform practices and reverse trends now killing us and the Earth.

The moral, environmental, and health arguments for adopting vegetarian and vegan diets have been convincingly made in books like John Robbins' *Diet For A New America*, and Howard Lyman's *Mad Cowboy: Plain Truth From the Cattle Rancher Who Won't Eat Meat,* and Dr. Will Tuttle's *The World Peace Diet*. Yet these valuable books have not explored how raw (uncooked) vegan diets can help propel a great leap forward for those seeking to minimize harm and maximize benefit to the Earth. Books on raw and eco-conscious eating are proliferating, and many teach important and inspirational facts on the connection between a raw diet and a healthier environment. It would take a book to detail all the benefits, so let's just briefly review the primary problems and the solutions available now via raw, organic, vegan diet choices.

1. Soil Depletion/Malnutrition/Famine

We can view this as one mega-problem and probably most critical: the cumulative effects of 11,000 years of depletion of soil minerals and organic matter have been vastly

accelerated by the rapacious chemical-forcing and fertility-mining practices of "modern" agribusiness. A raw, organic vegan diet sets new standards for quality and the methods for its attainment! If the majority of people adopted this diet, imagine the drastically increased demand for high-quality organic produce! When farmers remineralize soils with mixed rock powder and plant-derived compost, avoiding the byproducts of animal enslavement and slaughterhouses, this lays the biological foundation for a truly regenerative, abundant, healthful and thriving veganiculture. Visualize the beautiful diversity of gardens, farms, fruitful orchards, and forests rejuvenating so much land now in an ugly, depleted state. This process of regeneration and re-fruition is happening now, insofar as we live as conscious producers and consumers who insist on enlightened care of our small planet–this rare shining jewel in the vast Universe.

2. Human Health: Degeneration/Insanity/Violence/War/Extinction?

The worsening cancer epidemic, with 1 of every 2.15 people in America expected to harvest a crop of cancer in his/her lifetime, stands in stark contrast to Nature's promise of perfect health. This should inspire us to sow the healthiest seeds possible in every aspect of living. Cancer tops a long list of interconnected physical, mental and spiritual diseases that plague humankind, revealing the extent of our degeneration. Simply observing most people and the daily "news" also reveals this degeneration. A raw, organic, vegan, fruitarian diet–most wisely as part of a complete system of "health by healthful living"—can supply all the essential nutrients as found in food grown from fertile, mineralized soils, free of the toxic byproducts of animal-based chemical agribusiness and cooking. It can virtually eliminate all disease—starting now—by removing the primary causes: body toxicity and nutritional deficiency.

3. Deforestation/Desertification

The primary causes of deforestation and desertification are land-clearing for cattle raising, use of wood and other biomass as cooking fuel, and the ongoing depletion and dying of soils. The Fruitarian diet removes these causes and promotes reforestation and orchard plantings by Nature and "Wise man." Remineralizing new orchards and forests is crucial, as is remineralizing the existing acidified, impoverished late-interglacial forests. Evidence shows these forests are increasingly stressed and dying from insect and disease epidemics, climate extremes, and forest fires, thus transferring vast amounts of carbon

from land to atmosphere...which brings on more climate extremes, more fires like those which have been burning much of Southern California and the western US—in short, a cycle of degeneration calling for a generous response of regeneration. See how generosity and regeneration are related?

4. Air Pollution/CO_2 Buildup/Climate Change/Famine

Soil remineralization and reforestation reverses the CO_2 flow from soil and plant life! A Fruitarian diet hugely reduces energy expenditure and CO_2 emission by eliminating demand for cooked foods, which also means elimination of demand for most refrigeration, packaging, and, when we create fertile abundance in bioregions everywhere, most long-distance shipping of food, fiber, and fuel. Naturally, this is wholly preferable to ruining our global climate, whether by "global warming" or–as much evidence is warning us—by an accelerated onset of the next glacial cycle in our current Ice Age.

5. Fossil Fuel/Nuclear Energy Addiction

Soil remineralization, a vital key to successful raw Fruiticulture, can enable us to grow the biomass/alcohol fuels to meet the saner, reduced demands of a raw, vegan, health and peace-oriented culture. We can swiftly wean ourselves from our addictions to these ecologically-obsolete energy forms. Up to 2000 farmers per week have been going out of business in the U.S. over the past 30-plus years, while over a billion dollars per week is spent on oil imports. This is clearly a national and a global tragedy in need of immediate transformation.

6. Toxic Waste

A committed, eco-conscious raw vegan lifestyle can minimize toxic waste beginning now, and phase it out soon. As for existing toxic wastes (and human sewage which is now usually toxic), it has been demonstrated that their microbial decomposition and detoxification is possible, practical, and necessary. Here again, the generous feeding of mixed rock dust and organic matter to the microbes will help their proliferation and priceless foundational work.

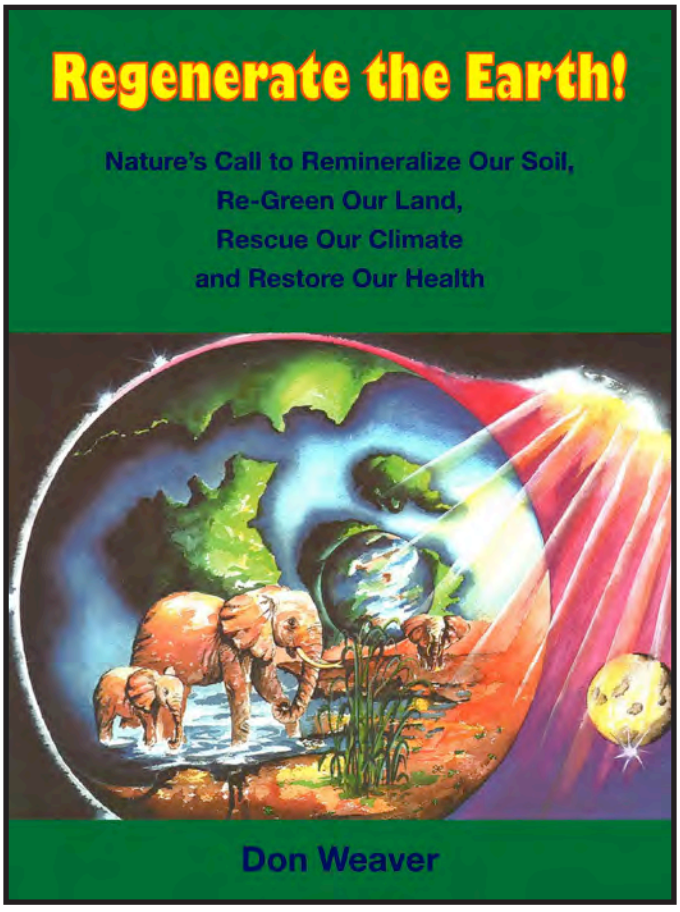

7. Animal Exploitation/Killing

We can minimize the suffering of exploited animals quickly, and potentially end it entirely, as worldwide compassion and the balance of nature is restored. To continue need-

lessly enslaving and killing billions of our fellow creatures each year must surely be intolerable to the compassionate conscience of our awesomely gifted species. Obviously, it is up to me...and you?

"It is not because things are difficult that we do not dare,
it is because we do not dare that they are difficult."
- Seneca

To give yourself a powerful education in Earth Regeneration,

PART III
THE GLOBAL SOLUTION

"One-half of the Earth's land mass is grazed by livestock."
-Lester Brown, et al., "Vital Signs 1994"; Worldwatch Institute (1994)

"Only two percent of U.S. cropland produces fruits and vegetables."
-U.S. Department of Agriculture Agricultural Statistics (1989)

"Permaculture offers a radical approach to food production and urban renewal, water, energy and pollution. It is a philosophy of working with, rather than against nature—the harmonious integration of the landscape, people and appropriate technologies, providing food, shelter, energy and other material and non-material needs, achieving a resource of great diversity and stability in a sustainable way. The design principles are equally applicable to both urban and rural dwellers."
-Bill Mollison

"Fruiticulture is a way of life; a culture, a philosophy. At its very core, Fruiticulture is a way of designing all human systems so that they integrate harmoniously with ecology. Veganic Fruiticulture is the ultimate ideal for a sustainable, vibrantly thriving culture. There simply is no better way of living in harmony with Mother Nature and being true to our frugivorous nature than to create cruelty-free, abundant fruit forests in every open space available."
-Jesse Krebs, Ph.D.

"Regenerative agriculture provides answers to the soil crisis, the food crisis, the health crisis, the climate crisis and the crisis of democracy."
-Dr. Vandana Shiva

Fruiticulture

by David Klein, Ph.D.

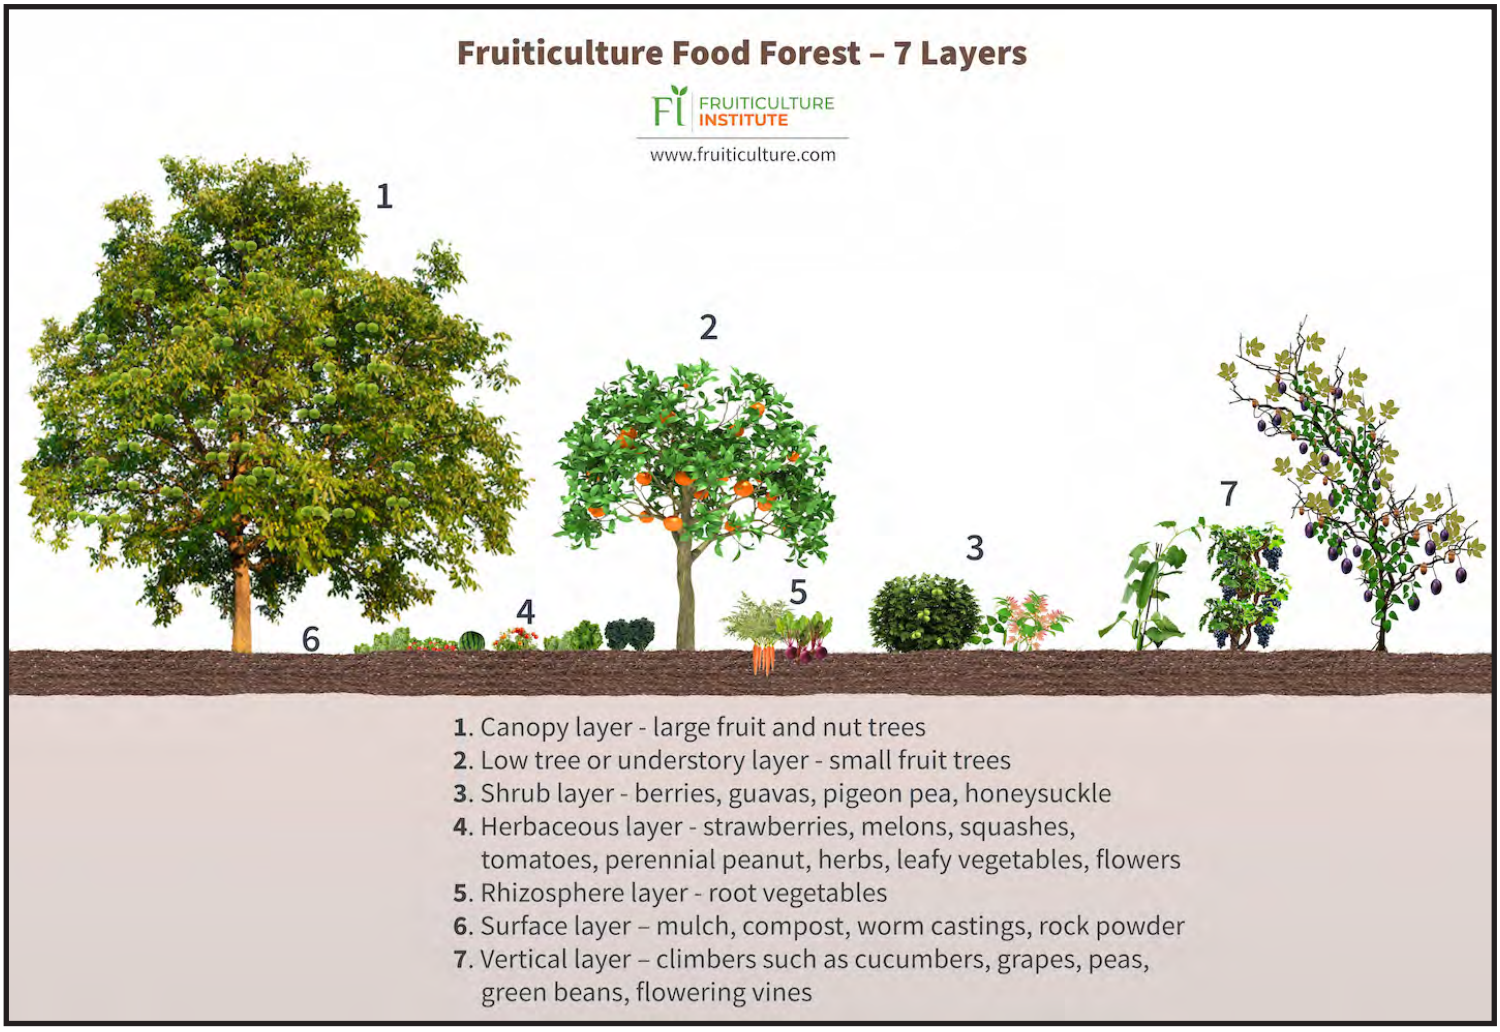

The Natural Way: Fruiticulture

As humans are biologically, physiologically and anatomically best suited to a fruit-based diet, and because fruit is the best source of carbohydrate fuel for our cells, and because well-grown fruits are nearly nutritionally complete, and because nothing tastes more delicious than luscious fruits, and because every species of animal that eats its natural biological diet does not experience the toxemic and degenerative disease that humans do (unless fed cooked food and exposed to chemical pollutants), and because fruit trees beautify and improve every aspect of our ecosphere, we will be wise to replace agricultural lands that are devoted to grain and livestock farming with fruit-centric, regenerative agriculture—"Fruiticulture."

Fruiticulture Fully Defined

Fruiticulture is a conscientious, civilized, regenerative way of living in harmony with Nature, consonant with human's natural dietetic character: frugivore. It is a culture of living reverentially, wholistically, symbiotically, synergistically, healthfully, and sustainably, employing biomimicry, diverse organic horticulture, and complementary "green" design practices, and establishing local and global communities and economies based on fruit, vegetable, nut and seed growing and eating.

Fruiticulture is the most sustainable form of agriculture for our planet. Its method is planting the gamut of vegetable crops under and between diverse fruit and nut trees, employing site-generated green waste mulch, compost, worm castings and locally-sourced mineral-rich rock powder amendments as fertilizers. This naturally improves the fertility of the soil ecosystem, returning more to the soils than is removed, while sequestering CO_2, reducing greenhouse gases, helping to stabilize the climate, regenerating the Earth, and creating food forests of abundance. Farmers can collect the seeds of a portion of their fruit and vegetable crops and grow independently of seed suppliers. Food forests would enhance every aspect of life on planet Earth!

The Great Potential

Food forests of fruitful abundance would enable those working in the toxic agro-chemical industry find new, healthful green jobs!

Nothing depletes our soils so much as grain growing, corn in particular, and cattle farming. Livestock farming degrades land and water resources. Artificial fertilizers contain few nutrients and they ruin our soils, making them more subject to erosion, and the crops they stimulate are nutrient-poor, especially lacking in vital trace minerals which the plants and we need to attain vigorous health and disease resistance. The use of herbicides, fungicides and insecticides severely disrupts or totally kills off beneficial predator insects, earthworms and the soil microbes that give our soils their fertility. These practices have killed off great populations of the bees upon which most fruit crop pollination depends, and they have made crippling and fatal human disease conditions commonplace in countries where conventional agro-chemical farming is the norm.

"You can solve all the world's problems in a garden."
-Geoff Lawton

"Try to dream with me my dreams of fruitful acres.
Do not be a slave to an old conception."
-Jack London

"Man's home is in the orchard."
-Dr. Herbert M. Shelton

In the table on the next page are some relative figures showing the productivity of fruit, vegetable, nut, legume, grain and animal foods employing conventional farming methods. The table was included in an article that the late Dr. T. C. Fry wrote in the 1980s. I was not able to find the source. Although the figures are old, their impact on human welfare and world ecology is nevertheless startlingly self-evident. In my quest to compile recent crop yield statistics, I found numerous sources of fragmented data from different regions where different farming methods are used, rendering it impractical to pull together an updated single chart. Nonetheless, it's certain that the cited fruit and vegetable production numbers can be increased dramatically, even quintupled, using today's advanced permaculture farming methods.

In 2007 I interviewed David Blume (www.permaculture.com), one of the fathers of the Permaculture movement (*Living Nutrition* magazine volume no. 20). Mr. Blume stated: "During the '90s I pretty much focused on sustainable agriculture and farming. I had 450 people eating all their vegetables from my two-acre polycultural organic farm. Of course I'm sure they also bought other things. We were delivering 10 pounds of vegetables per person per week. And we never really had more than two-thirds of the farm in cultivation at any one time. The rest of the time it was in cover crop. We had about eight times the yield that the U.S.D.A. says is possible."

If you ask any Permaculture farmer about optimum crop yields, he or she will likewise rave about numbers that far exceed those that conventional agriculture can achieve; the same holds true for the few but increasing legions of Fruiticulturalists.

AGRICULTURE PRODUCTIVITY CHART

FOOD ITEM	AVERAGE ANNUAL YIELD PER ACRE (lbs.)	NET PRODUCT DRY WEIGHT (lbs.)
Bananas	30,000	7,500
Dates	5,000	4,000
Grapes	10,000	2,200
Oranges	16,000	2,000
Pineapples	5,000	4,000
Figs	10,000	2,000
Apricots	12,000	2,000
Apples	18,000	3,000
Peaches	14,000	1,600
Pears	8,000	1,400
Avocados	12,000	3,500
Tomatoes	18,000	1,100
Melons	10,000	650
Cabbage	20,000	1,600
Pecans	3,000	2,500
Almonds	1,500	1,200
Sweet Potatoes	12,000	2,400
Potatoes	12,000	2,300
Corn	2,000	1,700
Wheat	1,200	1,080
Rice	1,200	1,080
Soy Beans	1,500	1,350
Peanuts	1,500	1,400
Oats	1,000	900
Milk	2,500	350
Cheese	250	175
Eggs	130	90
Beef	150	45
Pork	300	75
Poultry	200	55

The average human requires about a pound of food (dry weight) daily, varying somewhat with the foodstuff. Thus, an acre of bananas will, if it amounts to about 50% of the diet, support about 40 people. At the other end of the spectrum, comparably, it requires two acres of animal products to support a single human. I n other words, bananas supply human needs not only better but they furnish about 80 times as much food per acre than does animal agriculture.

Fruits, nuts and vegetables generally supply us with some 20 to 80 times as much food per cultivated acre than if we eat animals and animal products—and far more if Fruiticulture methods are employed. Fruit and nut trees will grow on rough and rocky mountainous and hilly areas that cannot otherwise be cultivated. Furthermore, animals graze poorly in such areas and cause a tremendous amount of erosion or soil loss. Fruiticulture is feasible in all landscapes in non-polar regions, as Permaculture master Geoff Lawton has demonstrated time and time again—see: www.geofflawtononline.com/videos/. To learn how generous tree planting can dramatically transform a landscape and local climate, read *The Man Who Planted Trees* (1953) by Jean Giono.

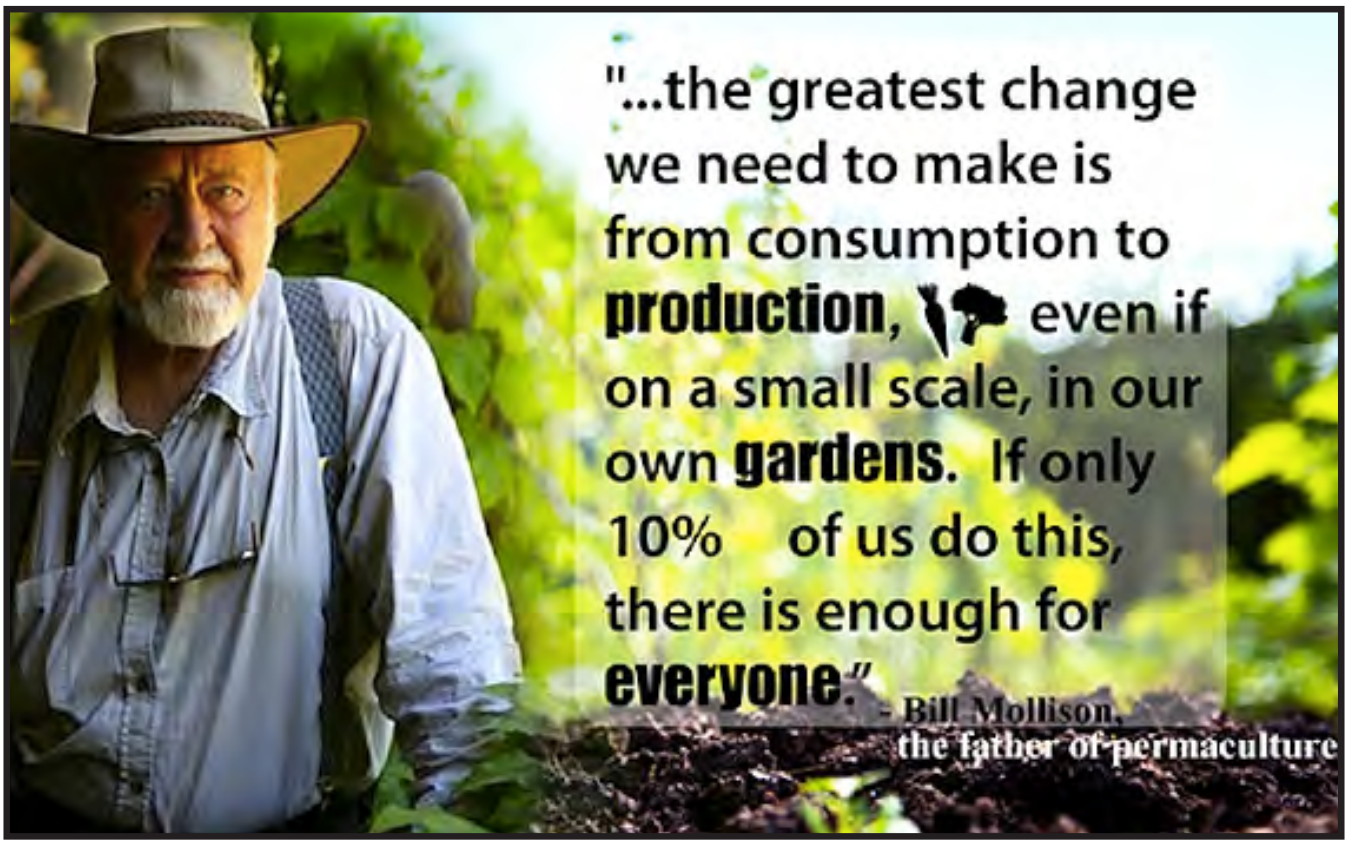

Fruiticulture food forests can be implemented not only at farms, but in all urban and suburban settings: from residential properties with lawns and woods, to city parks, to highway parkways, to school and hospital grounds, and all other green and empty spaces. These will feed and beautify our world, and improve air quality and climate stability. The gains in human and animal health would be epic!

If America were to devote as much to fruit, nut and vegetable culture as it presently devotes to animal culture, it would feed perhaps five times as many people as it presently does. The world can feed 10 to 30 times its present population, if the best use were made of our resources. Local green economies would thrive and displace toxic junk food industries. Disease rates and healthcare needs would plummet. Hospitals would be nearly empty; the medical and pharmaceutical industries would become nearly obsolete.

If the world were to adopt Fruiticulture and embrace natural health education, this could arrest and possibly reverse the impending catastrophic effects of climate change, eliminate diet-related diseases, and make the whole world a veritable Garden of Eden, a peaceful Planet of Abundance and unlimited vibrant health. The time is ripe!

No More Hunger, Poverty, Disease, Pollution, Wars

by David Klein, Ph.D.

"You may say I'm a dreamer
But I'm not the only one
I hope some day you'll join us
And the world will be as one"
-John Lennon, Imagine

With the absence of internal toxicosis and an abundance of fruit, the true nature of humankind is more readily revealed: wise, beautiful, serene, secure, happy, loving, respectful, helpful, caring, nurturing, generous, ingenious, peaceful.

Those who I've witnessed partaking in the Fruitarian Diet embody all of those qualities, and they are all doing good things in our world. They are successfully living the Fruiticulture Lifestyle after departing from destructive, conventional "deathstyles" that lead the world up to this point of crisis. We all wish that "the world will be as one" great cooperative Fruiticulture Paradise.

So, I hope that you realize that our Fruiticulture dream can become global reality—the world is waking up to the realization that we really have no choice other than to get back to Nature. We must expect that "wise man" (Homo sapiens) will realize that Fruiticulture is the most sensible solution for saving and transforming our world to flourishing wholeness.

I'm sure you're familiar with the "hundredth monkey effect." This effect actually saved my life and led most of the contributors to this ebook to a Fruitarian awakening that transformed their health, and led to our connection. My point is: please spread the message of Fruiticulture—please talk this idea up, plant more fruit trees, and share this ebook far and wide...for the love of all we hold dear and sacred!

How can Fruiticulture deliver the promise of no more hunger, poverty, disease, pollution and wars?

No More Hunger

There would be no hunger if local communities learned and embraced Fruiticulture. This would make sharing communally with those who need healthful food easy.

A proliferation of Fruiticulture fruitscapes on suburban lawns, backyards, city green spaces, green belts, fields, highway right-of-ways, as well as the conversion of cattle, porcine, fowl, grain and soy feedlots, farm fields and grazing lands to diverse Fruiticulture farms with local farm stands and farmer's markets, will feed far more people on far less land in all populated regions on our planet, in an ecologically beneficial and sustainable manner.

The variety of fruit trees that is suitable for each climate zone (except polar) is ginormous and tantalizing. Greenhouses, fruit and vegetable dehydrating, indoor seed sprouting, and green-fueled produce transportation make winter season sustenance easy and eco-friendly.

Our #1 fuel source, simple carbohydrate, is the predominant calorie source of sweet fruits, and natural sugars in whole plant food is what the body is actually hungry for when we are truly hungry. The protein and fatty content of avocado, nuts and seeds easily meets all our needs for essential amino acids and essential fatty acids, and in delicious fashion. The Fruitarian Diet is perfectly sustaining and then some. There is not one nutrient in meat- and grain-based diets that cannot be amply furnished in the Fruitarian Diet. Don Weaver and I have thrived on this diet for a combined 75 years, as have some of our friends for many years. After lifetimes of malnutrition, growing ranks of Fruitarians worldwide are extolling the benefits of their new diet across all media platforms. They are also crowing about how shifting their priorities to living simply and securing the highest quality fruits and vegetables is saving them money by reducing junk food and medical expenses and elevating their lives.

No More Poverty

With Fruiticulture farming, poverty would become a thing of the past for two reasons:

1. An overabundance of nutritious food would always be available, and farming and pro-

duce selling would easily employ everyone of all skill sets. There would be vast employment opportunities in cooperative fruit-centric farms and in produce distribution ventures, produce stores, shops and marketplaces, green businesses that manufacture environmentally-friendly, sustainable products grown on Fruiticulture farms, "green" building material construction, and "green" technology development.

2. Nourished on a 100% diet of healthful food and gainfully employed in vital, enriching, "green" jobs that keep us in good physical and mental shape, everyone will feel fantastically well and like they have it all, and they'll come to understand the truth in the old chestnut: "Health is our greatest wealth." No one feels poor when they are vibrantly healthy!

No More Disease

"Diseases enter by mouth."
-Chinese proverb

"Diseases linked to unhealthful diet and lifestyle choices, such as diabetes and cancer, are the leading causes of death in the United States, according to data published in JAMA."
-Physicians Committee for Responsible Medicine, April, 2018

"In reality, the major causes of chronic diseases are known, and if these risk factors were eliminated, at least 80% of all heart disease, stroke and type 2 diabetes would be prevented; over 40% of cancer would be prevented. Healthy diets play a key role in the prevention of cardiovascular diseases, cancer and diabetes."
-World Health Organization

"A new comprehensive study entitled "The Global Burden of Disease" was published in the medical journal The Lancet and revealed 71.3 percent of deaths in 2015 were caused by dietary and lifestyle choices—as compared to only 57.6 percent in 1990."
-VegNews, May, 2016

"As a conservative estimate, more than 80% of our chronic diseases today are directly related to our rich American Diet—high in calories, fat, sugar, salt and cholesterol, yet poor in fiber, nutrients, and natural taste."
-Hans Diehl, DrHSc, Clin. Professor Preventive Medicine, Loma Linda University,and founder of the Complete Health Improvement Program (CHIP) and the Lifestyle Medicine Institute

With our combined 300-plus years of professional experience, I and my doctor associates assert that the Fruitarian Diet is superior in health and longevity benefits to any other diet.

Fruit is the only food that is toxin-free, provided, of course, that it is grown organically, as per Fruiticulture practice. Fresh, ripe, raw fruits, vegetables, nuts and seeds pose virtually no toxic, enervating burden on the body. A varied diet of Fruiticulture farm produce furnishes far more nutrients than any other modern day diet.

The result of eating the Fruitarian diet as part of a healthful Fruitarian Lifestyle is virtually disease-free vibrant health, with rare if no more toxemic and degenerative diseases, birth defects, infertility, and all of the suffering, aggressive and violent behavior engendered thereby. Common colds, influenza and the killer diseases of the West, such as Alzheimers, amyotrophic lateral sclerosis, asthma, cancer, colitis, Crohn's disease, diabetes, heart disease, meningitis, morbid obesity and stroke, will nearly cease to occur.

Suicide death statistics would fall dramatically, because a fruit-based diet promotes good mental health and feelings of wellness like no other, as well as freedom from drug addiction. Meaningful employment can be gained in "green" jobs, or simply farming at home, bringing satisfaction, wholeness and happiness.

Working outdoors performing farm work, under the sun, with fresh air and good exercise makes for happy, healthy and fulfilled people.

No More Pollution

Conventional chemical industries and their plethora of toxic products, including fertilizers, fungicides and pesticides, can be replaced with biologically positive "green" byproducts from the farm.

Manufactured herbicides, pesticides and genetically-modified seeds and foods can be totally eliminated.

All plastics can be made from biodegradable plant formulas.

Much of the steel, aluminum and synthetic structural building products we rely on can be manufactured sustainably from bamboo and hemp.

Pharmaceutical and medical industry products and wastes could be reduced by at least

95%.

Chemical waste dumps would cease, and solid waste landfills would become obsolete with the production of plant-formulated recyclable consumables and packaging.

"Green" sustainable fuels could be grown or collected on Fruiticulture farms.

Greenhouse gas emissions from cattle, fertilizer manufacture and fossil fuel burning would end, stabilizing and possibly correcting the perilous extreme climate trends.

Toxic agricultural land runoffs into streams, rivers and oceans would end.

Groundwater aquifers would no longer be poisoned.

Atmospheric releases of industrial fumes would end with the use of biomaterials.

Airborne dust from mono-crop field tilling and pesticide drift would end.

Transportation fuels, combustion gases and particulates for all industrial and military industries could be greatly reduced.

Livestock manure and slaughterhouse waste and pollutants would become a thing of the past.

Human sewage would no longer require expensive treatment plants that produce unusable sewage sludge and toxic effluent; this could be replaced with composting sewage systems that produce "humanure" fertilizer.

No More Wars

"For as long as men massacre animals, they will kill each other.
Indeed, he who sows the seed of murder and pain
cannot reap joy and love."
-Pythagoras

"The time will come when men such as I will look upon the murder of animals
as they now look upon the murder of men."
-Leonardo da Vinci

"I have no doubt that it is a part of the destiny of the human race, in its gradual improvement, to leave off eating animals, as surely as the savage tribes have left off eating each other when they came in contact with the more civilized."
-Henry David Thoreau

"Non-violence leads to the highest ethics, which is the goal of all evolution. Until we stop harming all other living beings, we are still savages."
-Thomas Edison

With an abundance of nourishing food that keeps...

- us clean inside,
- our endocrine and nervous systems working smoothly/agitation-free,
- us freed from daily poisoning/autointoxication, stimulation, depression, pain, discomforts from conventional cuisine, and
- our minds clear, and engaged in pleasant, grateful and constructive thoughts,

and with...

- cooperative use/sharing of lands,
- cross-regional food sharing and commercial trade,
- healthful agrarian industries, and
- a world of people with healthy bodies and minds,

there would be minimal or no...

- social turmoil,
- want and pillaging of others' food, land, natural resources, and people for slave work,
- toxin-fueled slaughter-mentality aggression,
- exploitation of natural resources and defilement of the world's natural resources,
- murdering of animals for food, and

- personal turmoil, crime, wars, and murder.

When the people of our world experience the satiety and inner peace that comes from a vegan diet of mainly energizing fruits, they will wake up to their capacity for compassion and recognize that condoning the killing of animals is uncivilized, immoral, unconscionable, and unethical, not to mention downright cruel, and that this devaluation of life in turn fuels the condoning of killing fellow humans—the great unconscionable, holy sin! War will be a sad thing of the dark past when humanity no longer poisons itself with toxic food fare and experiences the clarity and conscientious presence that allows us to live true to our peaceful, loving, bio-spiritual nature, in harmony with and respect for ALL life on planet Earth. This is what we each want, and when we experience this, we will embrace it for life. This is the path of love, and this is what it is to truly be a good Homo sapiens.

Sound incredible? To learn about the connection between toxic diets and aberrant behavior, read *Diet, Crime and Delinquency* by Alexander Schauss. And, if you are not yet eating vegan-style, please try it for at least three months and discover for yourself the gains that we are loving, and the great potential of Fruiticulture. Should your need guidance and support, help is here!

"God made grow every fruit that was pleasant and good...
and God took man and put him into the Paradise of Delight to dress it and keep it."
-Genesis 2:9, 15

"I shall create new heavens and a new earth...
and they shall plant vineyards and eat the fruit of them."
-Isaiah 65:17, 21

"Grapes, peaches, berries, nuts, etc., are likewise provided for those who will sit at their sideboard. I have felt when partaking of this inspiring diet, than my appetite was an indifferent consideration; that eating became a sacrament, a method of communion, an ecstatic exercise, a mingling of bloods, and a sitting at the communion table of the world; and so have not only quenched my thirst at the spring, but the health of the universe."
-Henry David Thoreau

"Nothing will benefit health
or increase chances of survival on earth
as the evolution to a vegetarian diet."
-Albert Einstein

"Even chimps understand the concept: if a troop of chimps enters a fruit tree, they will only pick the fruits that are ripe and leave the others growing. That is sustainability."
-Jane Goodall

"There is no way to overstate the magnitude of the collective spiritual transformation that will occur when we shift from food of violent oppression to food of gentleness and compassion."
-Dr. Will Tuttle

"Fruit is the best source of food for the soul, the body and the mind. In the Bhagavad-Gita, Sri Bhagavan says: 'If with love and devotion, I am offered a leaf, a flower, a fruit or some water, I will accept it.' It's a way to divinity, the ultimate health."
-Patrick Bernard

"Fresh fruits are high vibration foods; they radiate with sun and light energy that passes to us when we eat them. If we do not overeat and are in a state of calmness and appreciation when we do eat, then fruits are an ideal way to raise our vibration and help create within us a state of harmony."
-Anne Osborne

"A period of six months is all too short to arrive at any definite conclusions on such a vital matter as a complete change of diet. I can say, however, that during this period I have been able to keep well where others have been attacked by disease, and my physical as well as my mental powers are now greater than before. I may not be able to lift heavy loads, but I can do hard labor for a much longer time without fatigue. I can also do more mental work and with better persistence and resoluteness. I have advised a fruit diet for many sickly people, invariably with great advantage. My own experience, as well as my study of the subject, has confirmed my conviction that a fruit diet is the best one for us."

-Mahatma Gandhi

"The vegetarian diet plays a most important role in the spiritual life. Purity is of paramount importance for an aspirant. This purity we must establish in the physical, the vital and the mental. When we eat meat and fish, the aggressive, animal consciousness enters into us. Our nerves become agitated; they become restless and aggressive, and this can interfere with our meditation. But the mild qualities of fruits and vegetables, on the other hand, help us to establish, in our inner life as well as in our outer life, the qualities of sweetness, softness, simplicity and purity. So if we are vegetarians, it helps our inner being to strengthen its own existence. Inwardly, we are praying and meditating; outwardly, the food we are taking from Mother Earth is helping us too, giving us not only energy but also aspiration."

-Sri Chinmoy

PART IV
ACTION

Earth's Health is in Our Hands

by Don Weaver

"History records no more gallant struggle
than that of humanity against the truth."
-Ashleigh Brilliant

In the late 1970s, a few of us, including John Hamaker and myself, warned people about severe climate change and explained that it was due to fossil fuel burning combined with global deforestation, continuous soil demineralization executed by chemical agriculture, sick and dying trees and whole forests, and the fires that inevitably ravage such stressed and malnourished trees and other vegetation. In those days, we got our messages out to the world by mass mailing articles and letters, along with calls or visits to places like the Rodale Institute in Pennsylvania, the Congress, the EPA, USDA and environmental organizations in the San Francisco Bay Area and beyond. This led us to write and publish *The Survival of Civilization* in 1982 in an effort to provide an extensively documented case for regenerating the soil and Earth. Further documentation was offered in 14 issues of *Solar Age or Ice Age? Bulletin* and then in 2002 when I published the extensive book *To Love And Regenerate the Earth*. Other articles before and since were published as the ebook *Regenerate the Earth!* in 2011.

We were and are not only warning of the dangers ahead due to soil demineralization and consequent deterioration of plant health and the global climate. We were and are also publicizing the solutions of generous soil remineralization and general re-greening of the biosphere, acting locally and thus acting globally. We were (and are?) appar-

ently a bit "ahead of our time," since most people didn't understand the radical simplicity of giving back to the Earth's living soil its natural foods in greater quantity than we mine them from the soil through agriculture and (de)forestry. From 2015 to 2018 we have seen new records for fire damage in Alaska, Washington, Oregon, California and other drought-stressed regions, while elsewhere "super typhoons" are devastating the Bahamas, Philippines and up to 27 inches of rain has flooded the Carolinas in just a few days! Recently, over 40 inches of rain fell around Houston, Texas! That is more than parts of California have received in the past five years! Worldwide soil erosion and demineralization continue to "undermine" our health and future survival chances. "Natural" disasters have become the new normal, as the large insurance companies and their growing damage statistics will attest.

Ecological Action

We need to swiftly, consciously and wisely become the generous species on Earth. We've taken so much from the soils, plants, trees and animals; we have a huge debt that must be paid to restore our own vibrant health and that of the whole interdependent chain of life. Fortunately, we can do this by remineralizing the world's soils with natural mixtures of rock dust, returning the increased amount of organic matter back to the soil. This will build its fertility and depth while enabling abundant production to meet our needs for pure natural foods, fiber, timber/bamboo, biomass energy (alcohol, bio-diesel, wood, hemp, etc.), as well as beautiful landscapes, parks and wildlands. On 8/2/08, Reuters gave the news of General Motors' plan that half of their new cars will be fueled by ethanol by 2012; current cars can be converted to run on a bio-fuel, electricity, or both.

By our choosing healthy vegetarian/vegan/raw-food lifestyles, hundreds of millions of acres now used for animal-based agriculture and drug crops can be converted to organic-mineralized orchards, farms and new forest lands. Also, fast-growing tree plantations on remineralized soils can simultaneously build soil fertility and convert CO_2 to leaf and wood for alcohol fuel and wood energy. Leaves and residues can be returned to the soil. This can replace the practice of burning carbon stored in the ground as oil, coal, and natural gas, which is wrecking our interglacial climate.

This conversion can eliminate what currently comprises 20% of total CO_2 emissions from

animal "husbandry," enabling us to quickly plant the many billions of trees needed to bring CO_2 down from about 408 ppm to a stable interglacial level of about 280 ppm. Remineralizing much of the current forest land will greatly reduce the widespread disease, insect and fire epidemics, enabling forests to again grow healthy and strong. This will pull in billions of tons of CO_2 through renewed nourishment and vibrance from soil microbes up to treetops. It will reverse soil acidification, allow the soil life-system to hold much more moisture for year-round availability, and ameliorate the increasing "tinderbox" conditions in many malnourished forests. Stabilizing CO_2 levels and the planetary climate is the sensible approach if we want to save what is left of our forests and nurture the growth of new ones over much of the Earth.

Whether you lean toward the widely accepted "global warming" theory and related evidence, or the "new glacial period" thesis and evidence as put forth by John Hamaker and others, including myself, I think we can all agree on the wisdom of remineralizing and re-greening the Earth to reverse the current slide into "climate chaos." For example, in recent years, there were record cold and crop-destroying snowstorms all the way into southern China, Greece, the Middle East, Florida as well as north to Alaska, Canada and Greenland, with the highest level of Northern Hemisphere snow cover in at least 52 years.

Along with the understanding that we've about reached "Peak Oil," we need to realize our soil-devouring civilization has already passed "Peak Soil." Earth is in urgent need of replenishment. Can the human mind and heart awaken and shift from egocentric to ecocentric, from the shortsighted habits of Earth-exploitative materialism to Earth-regenerative compassion, simple eco-living and co-creation of natural abundance and health for all?

Fruiticulture Can Restore "Earth Health"

Stephan Reeve's farm on Maui is another model of the health-oriented agriculture of the future, thriving on 11 acres of previously neglected pastureland. Former San Franciscan Stephan Reeve and his family have co-created an Edenic garden and orchard with generous soil remineralization, mulching and composting, å la the Hunzans. The farm produces a growing abundance of mineralized avocados, mangos, papayas, lychees, jackfruit,

sapotes, tangelos, rambutans and many others, probably exceeding the variety grown in Hunza. Continued generous remineralization and compost return should soon allow the farm to match the quality of the Hunzan "Shangri-La." Why don't we all strive for such high standards of soil fertility, food quality, health and active longevity?

While I'm fortunate to have some mineralized fruits and veggies year-round from my gardens here in California, my two weeks working at Stephan Reeve's farm on Maui a few years ago was extra-nourishing and rejuvenating to body and spirit. Along with eating a variety of fresh, ripe, mineralized produce, renewing great friendships and swimming often, my rock dusting of a new grove of rollinia trees was a highlight as I love to help young trees grow to healthful fruition. Not only are rollinia trees very beautiful and fast-growing, the rollinia fruit has earned a spot on my top five fruits of the world list, along with sapote, durian, atemoya, apricot…and perhaps tied with nectarines, cherries, peaches, persimmons and pineapple.

The wonderful fact is that when we grow foods in remineralized and organic matter-enriched soils (animal manures and slaughterhouse byproducts are not needed, thankfully), the development of the flavor and of all the health-promoting compounds can, if you are truly hungry, make each food a favorite at the time of eating! The more we intelligently give to Nature, the more Nature gives back, often 100-fold or more!

The fruits and vegetables of remineralizing farmers Bob Cannard, chosen by Alice Waters to supply the produce for Chez Panisse restaurant in Berkeley, and Rick and Kristi Knoll at Tairwa Farm in Brentwood, California, also earned high praise. Now with California's largest organic farm, Cal-Organic, adding at least 3,000 tons of Summa Minerals rock dust to their increasingly remineralized acreage, it is clear that mineralized-organic can succeed from the smallest garden to the largest farm, and beyond. The need for global Earth Regeneration work can eliminate unemployment and make crime as scarce as it is in the well-nourished, "Engaged-with-Nature" cultures. The real crime is our neglect of healthy human development, such that over 2.2 million are now imprisoned in the U.S.

The fact that crime, war and ecological destruction are virtually unknown in cultures such as Hunza that Robbins writes of in *Healthy at 100*, tells us that these are extremely unnatural practices; their existence in our own culture is telling us we must heal our-

selves at every level of being, in every interrelationship and "from soil to psyche."

Wouldn't it be great if, instead of spending 5 billion dollars or more per week on warfare, we would use it to fund all the crucially needed Earth Regeneration projects? Is anything more important? A new and vibrant Earth calls us forward. Now is the time to exercise our "response-abilities" and to express our love and thanks for the "Gift of Life"!

What You Can Do

1. Start a garden/orchard/farm/Earth Regeneration Center to provide food, beauty, and inspiration to yourself and others. Buy seeds and trees from independent and organic growers whenever possible as there is a major corporate push to take over, hybridize, chemicalize, and genetically modify agriculture and the food supply. Save seeds and propagate plants yourself, as well. Start a plant and tree nursery.

2. Remineralize the soil, make compost, feed the microbes and earthworms to restore the foundation of health and life.

3. Buy only organically-grown foods and other natural products; try eating mostly or only plant foods and mostly or only fresh/raw/ripe foods; share the good news about soil mineralization and organic growing practices with farmers and as many people as you can.

4. Simplify every aspect of life to promote health for people and planet; work together with those supporting global health; withdraw your support from those people and companies whose practices are harmful to the ecosystem and encourage them to go constructively green.

5. Become knowledgeable about your own region as well as about the world in general so you may better influence local and global politics and consciousness through writing, speaking and leading new positive initiatives. Community gardens/orchards, tree nurseries and tree-planting projects are needed almost everywhere, as are more Community Supported Agriculture enterprises, natural food potlucks and healthy living education centers and events.

6. Explore co-housing and cooperative community and eco-village options for you and

your loved ones, and/or retrofit your current residence for increased solar power, food growing and green living. Study Permaculture and Fruiticulture principles to see how they apply to your living and growing environment.

7. Help schools start organic, mineralized gardens and orchards—Berkeley's "Edible Schoolyards" founded by Alice Waters is an example to build upon. Share Nature's beauty and miracles with children to prevent further spread of "Nature Deficit Disorder."

8. Add to this list according to your nature and inner inspiration, and try out the advice to "be the most positive person you know."

Stephan Reeve in his Fruiticulture food forest
Maui, Hawaii

Planting Your Home Orchard

by Don Weaver

"It is impossible for man to evolve mentally unless s/he participates in the creation of the world. This is a very simple way to participate. Fruit trees and nut trees marry the earth and sky. They give shade and food. They are a powerful symbol. To plant a tree along a public road, that is an act of generosity. Lack of heart, lack of generosity, is the real disease in our world."

-Bernard Moitessier

I have been gratefully enjoying a growing supply of fantastic mineralized fruit in recent years, and now I find my home orchard is fully planted! So I accept a soft place under freshly-leafing chocolate persimmon to encourage you to share this inspired feeling of shared nurturance and nourishment of mind-body-spirit...and Earth!

Have you noticed the countless efforts made to experience greater health of indivisible mind-body-spirit, but too often "Earth" is divided off or forgotten and an essential unity is severed or misplaced? Please never undervalue the Soil-Earth-Health complex of beautiful relationships. Don't we all want and truly need more beautiful relationships in our lives? Might you start on your present "homestead"? If you see any soil and receive about six or more hours of sun per day, and live south of the Arctic Circle, your chances are excellent.

To consciously begin your symbiotic relationship with the Earth by planting orchards and gardens is a direct, radical step toward total perfect health for you and the Earth—for you as a caring, intelligent part of the Earth. As your caring translates to giving wisely and generously to soil-and-Earth, Nature's response translates into the natural spectacle of Healthy Abundance and Fruitfulness. This includes Nature offering back the beautiful, pure, vibrant living foods we need for real human health, thus completing this most sacred symbiotic relationship cycle.

If you aren't aware of how strongly and urgently Earth and humanity are crying out for this "win-win" relationship, it only takes a little time and study—or simple observa-

tion—to become "painfully aware" of humanity's local/global confusion and "relationship problems"!

So, if you're exploring the course of wisdom and this work of re-greening and regeneration appeals to you, shall I now tell you "how to?" I'd say please question all "how to's," especially as each moment and circumstance and set of interrelationships is unique and new, but I'll suggest some principles to consider:

1. Soil organisms largely "run the show" below and above ground, so providing them with a generous supply of their natural diet of mixed rock minerals and organic compounds, such as your own homemade composts and mulches, is of primary importance.

2. Find good tree (and seed) sources, using organic methods. I've also "adopted" a number of free or inexpensive trees from un-organic nurseries, knowing with "TLC" and plentiful feeding I could help them "get off the drugs" and become upstanding members of the Healthy Tree Community. Some trees may be grown from seed, but the seedling may be quite different than the parent! My nectarine tree from seed gives wonderful fruit.

3. Fertilize adequately in the planting hole and also in the surrounding future rooting area. In typical infertile, tough ground, I use pick and spade to make a hole approximately two feet deep by three feet across, place the tree at right level, below any graft union, then mix rock/gravel dust and compost in with the original soil in roughly a 5-20-75% ratio. Then I provide a future nutrient supply by topping with a good compost/rock

dust mulch, berming up the outside to create a wide watering basin. In richer soil, like garden soil, a smaller hole and less immediate root zone fertilization may be sufficient. Consider all of the tree catalog suggestions, also library books if you wish (but question those "how to's" that sound unnatural), water the trees as needed, and enjoy a pure and beautiful relationship!

"Then what is the answer?
Integrity is wholeness, the great beauty is Organic wholeness, the wholeness of life and things, the divine beauty of the universe. Love that, not man apart from that, or else you will share man's pitiful confusion, or drown in despair when his days darken."
-Robinson Jeffers

The Time is Ripe to Join & Lead

by Don Weaver & David Klein, Ph.D.

Be Such A Person

by Don Weaver

Envision a genuine, healthy civilization as one where the great diversity of human beings recognize our natural interdependent place in the far more diverse Planetary tree of life, and consciously work and live to enrich, support, and strengthen the entire growing tree.

I encourage you to explore the challenges and relationships in your life, and consider well the ecological wisdom of simpler, more natural living, enjoying the fantastic variety of beautiful, delicious, perfectly nourishing plant foods we can grow and eat without vast expenditures in processing, packaging, refrigeration, fossil fuels, and other problems addressed earlier. I invite you to join the great work of giving back to the Earth more than we take, so that we may all survive, thrive, and continue a conscious evolution of Life on a small planet! May these wonderful words inspire us all to take action:

"Be such a person and live such a life,
that if every person were such as you, and every life such as yours,
this Earth would be God's paradise."
-Phillip Brooks

Personal & Planetary Health: Inextricably Intertwined Matters of Integrity

by David Klein, Ph.D.

The time is ripe for all of us to change our worldview, visualize, come together, meet, share, learn, plan, teach and cooperatively create the kind of world we want to live in. It is our responsibility to do the right thing every day in the loving spirit of integrity.

Someone once said: "We must be passionate about a mission greater than ourselves." Our mission is the greatest of all: to come together, think with reason and act with integrity in restoring our world to a condition of sustainable health. We can choose to have faith that the current global crisis will force humanity to wake up to our symbiotic kinship with all life on Earth, assume a humble attitude of gratitude for all our gifts, reconnect with our sense of empathy for all life, and take responsibility for stewarding our shared "nest," and restoring the natural order of our world by abiding by the principles of Fruiticulture.

"If humanity does not opt for integrity, we are through completely.
It is absolutely touch and go. Each one of us could make the difference."
-R. Buckminster Fuller

What is it to be a truly conscientious human being, a good citizen of the Earth? To act with integrity in all matters needing care.

"It's not what we profess but what we practice that gives us integrity."
-Francis Bacon, Sr.

It is our life, our world—if we desire to live in Paradise, we each have to take full responsibility for making things better at every turn.

"Real integrity is doing the right thing,
knowing that nobody's going to know whether you did it or not."
-Oprah Winfrey

It is our choice whether we will diligently work toward optimizing our health, restoring the planet, caring for all that is vital to our existence, bringing light to darkness and creating a fruitfully sustainable world.

"Integrity is telling myself the truth."
-Spencer Johnson

We can choose to do the right thing, acting with integrity, or we can be lazy, ignore the work at hand, compromise our ideals, make excuses, gripe, pass the buck, assume it will get done by others, think change is impossible, worry, lose hope, despair, give up, do nothing, be silent and surrender our human spirit...it's our choice.

"Courage is the foundation of integrity."
-Keshavan Nair

Or, we can harness our passion, take the reins, marshal our energies and live our lives purposefully, with optimism and integrity.

"Integrity is the essence of everything successful."
-R. Buckminster Fuller

Do you believe the excuses your mind conjures, defeating your innermost desires to actualize perfect health? Do you see obstacles in your path, feel disempowered and believe you cannot be an effective agent of planetary change? None of these notions are real or true; none are worthy of your attention; none serve your highest good; none contain any essence of the human spirit.

"One of the truest tests of integrity is its blunt refusal to be compromised."
-Chinua Achebe

Imagine your loftiest dreams in every aspect of your life coming to fruition and passionately move toward them every day. Positive, constructive action renews life. Think, believe and act passionately, expressing, sharing, synergising, exemplifying and enjoying the process of improving every aspect of your life, your world and of creating the best possible future for you and yours. Allow the goodness within you to manifest your deepest desires. It begins with prudent care of our health and extends to the benevolent stewardship of all life on Planet Earth.

"Be daring, be different, be impractical, be anything that will assert integrity of purpose and imaginative vision against the play-it-safers, the creatures of the commonplace, the slaves of the ordinary."
-Cecil Beaton

Live as the embodiment of the best of all human traits: integrity. Let us each bring all the goodness in our heart to the world, for the love of life and good of all.

"Goodness is the only investment that never fails."
-Henry David Thoreau

Please Join Us!

The net gains of global Fruiticulture are, in a nutshell, the fruition of our deepest dreams of Paradise, or, if you prefer, Heaven on Earth. This is achievable on a global scale, precisely because of these four big reasons:

1. Fruiticulture is far easier and cheaper than any other form of agriculture, and it's doable in all non-polar regions.

2. In physically performing Fruiticulture farm work, we feel well in mind, body and spirit.

3. The Fruitarian Diet is far more delicious, nutritious, and health-promotive than any other diet; it enables us to realize our full potential as the person we have always longed to be.

4. Fruiticulture will induce tangible improvements in every aspect of life on Earth.

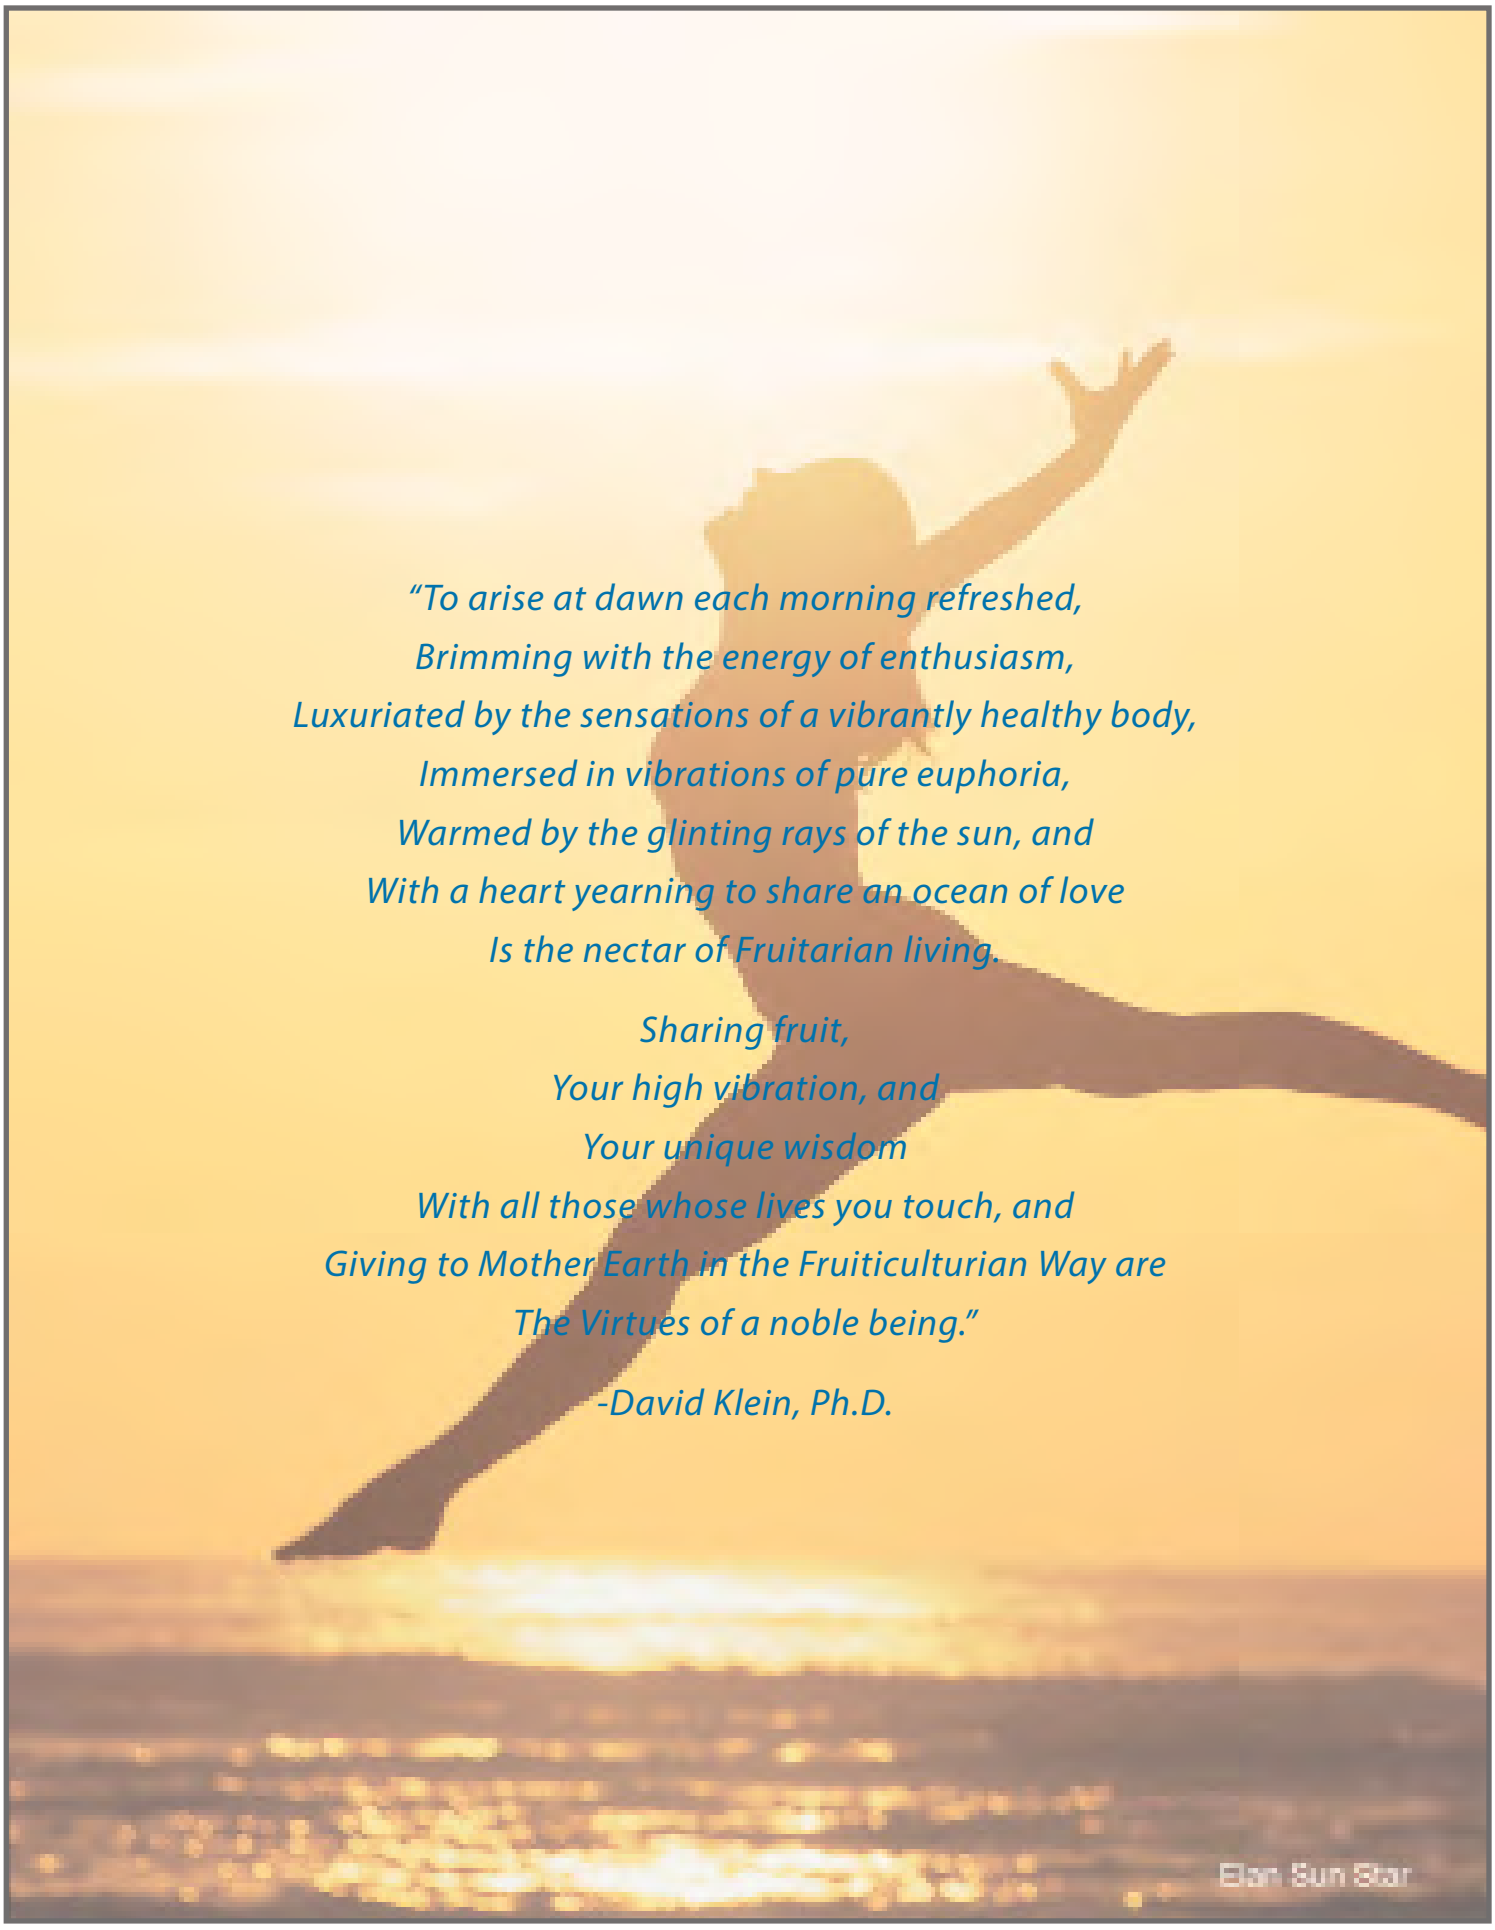

With the "100th monkey effect" in mind, please be the "next monkey" by joining us in teaching and living Fruiticulture. You'll feel better, be happier, and your example will spread the most vital message that the world needs to see and hear. We will be thrilled to hear from you, and all small and large deeds will be greatly appreciated and abundantly rewarded by Mother Earth and all her children! By the very act of sharing this ebook with others, you will be setting the effort in exponentially greater motion!

Love in combination with integrity is the force that will drive this great transformation. Together we will co-create the vibrantly healthy world in which we wish to thrive!

10 Inspiring Stats That Prove Veganism Is Going Mainstream

It's not a fad – and these numbers show it's here to stay

Plant Based News

It's an exciting time for veganism – and these stats prove it

Veganism no longer feels like a niche choice: plant-based living is becoming more visible. You can see this growth on social media, but also on the high street too, with more shops and restaurant catering to a growing vegan audience. Here's our pick of 10 key stats that prove veganism is only set to get bigger.

www.plantbasednews.org/post/10-stats-that-prove-veganism-is-going-mainstream

Google CEO Eric Schmidt predicts a "Plant-Based Revolution" with people "moving away from meat to plant-based proteins."

FORTUNE.COM - May 3, 2016. Schmidt sees a revolution coming in using plants to replace meat. Replacing livestock with growing and harvesting plants could reduce greenhouse gas emissions and fight climate change, he argued. The meat industry, cattle producers, in particular, emit significant greenhouse gases.

The development of plant proteins that communities could use to replace meat would also lower the cost of foods in developing countries where food is sometimes scarce. Delivering a pound of meat to the grocery store (raising it, slaughtering it, shipping it) is a relatively inefficient and costly process compared with delivering a pound of many protein-based plants.

"With realization of one's own potential and self-confidence in one's ability, one can build a better world."

-The Dalai Lama

"Love in combination with integrity is the force that will drive this great Fruiticulture revolution.

The time was never riper!

Together we will co-create the vibrantly healthy world in which we wish to thrive."

-Dr. David Klein

"There is no reason not to follow your heart."

-Steve Jobs

"Spread
the news:
Fruiticulture
is the word!"
FRUITICULTURE
INSTITUTE

APPENDICES

Appendix A

Hua Nui

by David Klein, PhD.

Introduction

The future Hua Nui (HN) will be a Vibrant Health Living & Learning Center on the Hawaiian island of Maui. Hua Nui means "fruitful" in the Hawaiian language. HN is the brainchild of Dr. David Klein of Haiku, Maui. HN will stand as a premier, exemplary Fruiticulture farm, institution of Vibrant Living and a beacon for wholistic health seekers and sustainable living enthusiasts worldwide. The academic enterprises of HN will be known as the Fruiticulture Institute and the Vibrant Health & Wealth Academy.

HN will include an organic farm, orchards, fruit tree nursery, and conference room / yoga studio. HN will employ sustainable, organic, veganic, regenerative Fruiticulture design and maintenance methods and provide Fruiticulture farm tours and Vibrant Health Education at its finest.

David will act as property caretaker, business manager and farm and health education director, bringing his 34 years of Vibrant Living expertise and indefatigable passion for helping the world to become a healthier place. He is seeking a benevolent property owner, partners and/or benefactors whose primary ROI objectives are personal and planetary Vibrant Health. Donations are tax-deductible through HN's fiscal steward, Tri-Isle Resource Conservation and Development Council, Inc.

The Hua Nui vision:
Fruiticulture
FRUITICULTURE INSTITUTE
Hua Nui
Vibrant Health & Wealth ACADEMY

Hua Nui
CONCEPTUAL RENDITION

Mission

After a longstanding illness, David's life was saved and uplifted by employing Hygienic principles of self-healing and by adopting the Natural Hygiene Way of Life (renamed Vibrant Living). His subsequent mission has been to introduce the world to the principles of Vibrant Living, and fruitcentric permaculture, and to educate and guide ailing people to Vibrant Health at every opportunity. HN will represent the culmination of his decades of experience and outstanding service to humanity.

Purposes

HN will stand as a model for sustainable, regenerative, veganic, Fruiticulture living. The farm will provide organic fruits, vegetables and fruit tree starters to island customers and feed HN residents. Fruiticulture farm tours, classes, workshops and trainings will be provided. The property will be placed in a living trust to assure its perpetual abidance to the Hua Nui mission.

Location

Maui is considered by many to be the world's #1 island destination and the most preferred luxurious residence for many health-minded people. With year-round warm tropical weather averaging 75 ^{0}F, a friendly "aloha" social climate, unbounded water sports and other recreational activities, favorable conditions for growing all tropical fruits, and scintillating scenic beauty, Maui is a healthful island of enchantment.

The location for the future HN will be a yet-to-be-determined coastal property in the town of Haiku on the North Shore region of the island. This area offers: 30-minute proximity to Kahului Airport, 20-minute proximity to beaches, elevation suitable for growing tropical fruits, stunning shoreline views and serenity.

Features

HN will feature fully organic, veganic, Fruiticulture-designed amenities to provide self-sufficient sustainability and promote vibrant health.

- Orchards
- Gardens
- Solar electric power
- Solar water heaters

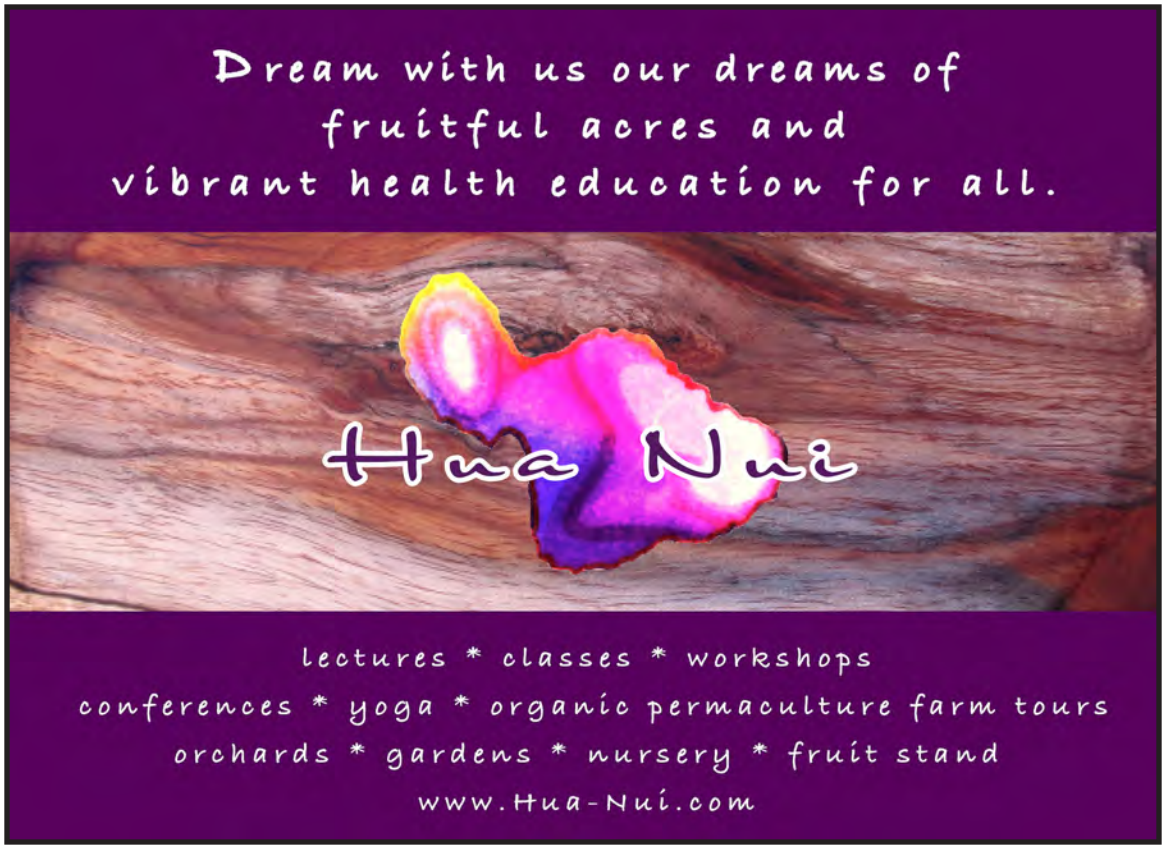

- Rainwater catchment tank and pond
- Gray water recycling
- Plant and fruit tree nursery
- Greenhouse
- Caretaker house
- Guest house
- Conference room / Yoga studio

Please Visit Hua-Nui.com and Contact Dr. David Klein

For full details, please visit www.hua-nui.com.

If you are excited about Hua Nui and would like to discuss your visions for a healthy and sustainable world, and how you can participate in the creation, sustenance, and co-habitation of Hua Nui, Dr. David Klein would love to hear from you via the contact form at www.hua-nui.com, or:

Phone: 808-572-0861 (Maui, Hawaii)
Skype: drdaveklein
Email: dave@digestionperfection.com

Appendix B

Earth Regeneration Centers

by Don Weaver

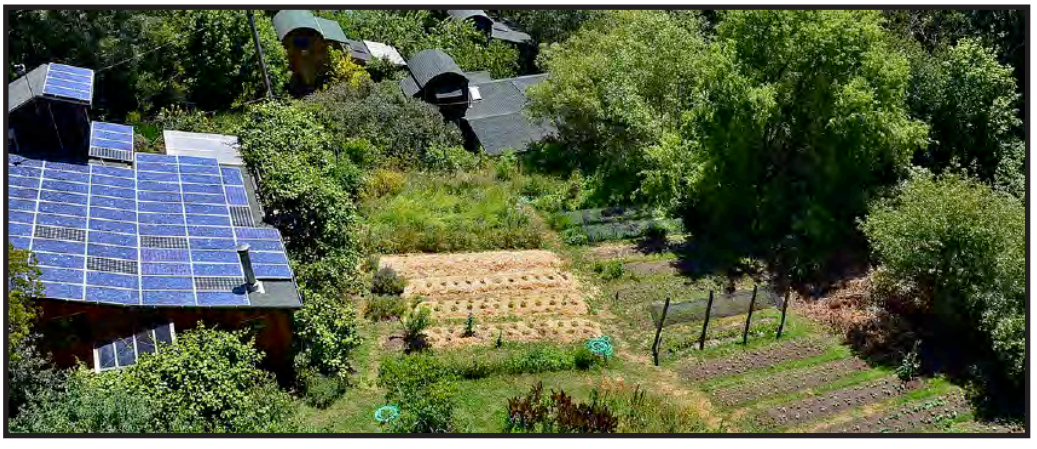

It was journalist/author Wes "Scoop" Nisker Who said: "If you don't like the news, go out and make some of your own."

I say: "If you don't like the "mass media" news about ongoing local-and-global pollution, soil erosion and deforestation, destructive weather and climate change, forced migration, malnutrition, starvation, violent conflict, poverty, social and economic injustice, wars, etc., here is a "radical" (meaning "to the root") idea: start an Earth Regeneration Center."

Regenerate: "To bring new and more vigorous life to (an area or institution); revive." That is one good short definition and can be applied to the environment, economics, human mental-moral-physical-spiritual health, and so on.

To start an Earth Regeneration Center, simply realize that you are one "center" of the Universe and that "regeneration starts with me." As we each willingly embrace the responsibility of living more regeneratively, we should see opportunities to extend our sphere of regeneration outward, to touch and help others do the same. That reminds me of the great saying: "The best exercise for the heart is reaching down and lifting others up."

I encourage you and others who wish to enjoy the regenerative life with you to find any amount of land to work with and start a garden, remineralize and replenish the soil, and quickly find out how different you may feel when directly eating fresh, mineralized garden produce.

You might learn that living a "garden-to-hand-to-mouth" existence has been underrated!

It's a wonderfully enriching enterprise to engage symbiotically with a living, verdant part of the Earth. You can start planting fruit and nut trees that are adapted to your climate zone. With a variety of fruits, nuts, and succulent vegetables planted on generously rock-dusted and compost-enriched soil, you will be on your way to a great diet while regenerating the Earth within your caring reach. For those of us aspiring and able to create an Earth Regeneration Center that is a model for the world at large, some other key components could include:

- Tree and plant nurseries
- Greenhouse for propagation/production
- Rock grinder powered by wind, solar, or biofuels
- Complete composting systems including composting toilets
- "Green" building materials and integrated living/growing/recycling systems
- To honor the full human life-and-death cycle, where permitted, a green burial area in a forest or re-forestation zone
- A comprehensive book and audio-visual library for all to learn from
- Farm tours and workshops
- Establishing a research/testing lab alliance for testing soil and produce qualities as remineralization and composting effects proceed
- Pond or lake creation where appropriate
- Establishing outdoor and indoor recreation and fitness facilities
- If more people continue to choose veganic growing and eating, there may be a need for more animal sanctuaries on your land

What else would you like to see as part of an Earth Regeneration Center?

Let's learn from what current Permaculture and intentional communities are doing around the world, as well as David's Hua Nui center that is planned to be an Earth Regeneration Center for the Hawaii bio-region, and invite mutual support with them.

It would be great if some Earth Regeneration Centers could be combined with a fasting/health Natural Hygiene Centers such as TrueNorth Health Center in Santa Rosa, California.

Can you imagine how such centers could effect the problems noted above and offer living solutions that could transform individual, societal and planetary health? If so, I hope you will find the inspiration and means to begin sharing these solutions and enjoying a more regenerative life with many others around the world!

I will be grateful to hear what ideas you have and what progress you're making, and offer any assistance that I can. I and co-workers are also seeking land on which to co-create Earth Regeneration Centers in California, Hawaii and elsewhere worldwide. Contact: earthdon@yahoo.com

Appendix C

Statistics Compiled by EarthSave and Cowspiracy

Food Choices and Your Health

http://www.earthsave.org/healthy.htm

There is overwhelming scientific evidence that what we eat has a profound influence on our well-being. The medical community is in agreement: for optimal health, they recommend diets rich in whole grains, fruits, vegetables and legumes, and low in fat, especially animal fat. Despite this, millions of North Americans continue to eat in ways that severely compromise their health. Please consider these realities:

More than 2,500 Americans die each day from heart disease, the number one killer of both women and men.

People eating no meat have 24% less heart disease than meat-eaters. People eating no meat and dairy have 57% less heart disease.

Physicians are able to reverse existing heart disease in more than 70% of patients by prescribing a low-fat vegetarian diet.

More than 1.2 million Americans are diagnosed with cancer each year, and more than 500,000 die from the disease.

A study of more than 11,000 people found that those eating a vegetarian diet have 40% less chance of contracting cancer than people who eat meat.

Health & Nutrition

Sixty-eight percent of all diseases in the U.S. are diet related.[1]

Obesity

There's been a 40 percent increase in obesity since 1966.[2]

Nearly 30 percent of the adult population (24 million people) is considered obese.[3]

Eleven percent of American children between 6 and 17 are considered severely over-

weight.[4]

Americans each consumed an average of 140 pounds of sugar in 1991.[5]

Diet and Disease

Total dollar costs and deaths from excess dietary fat far exceed costs and deaths from all forms of substance abuse, including tobacco, alcohol, and illegal drugs combined.[6]

Heart Disease is the most common cause of death in the U.S.[7]

Nine hundred and twenty-five thousand Americans die each year from cardiovascular disease.[8]

Forty percent of all cancers in the U.S. are diet related.[9]

Disease	Health Care Costs	Americans with Disease	Rate in Vegetarians
Heart	$40.4 billion	6.2 million	50-75% lower
High blood pressure	$12.5 billion	63 million	33-50% lower
Cancer	$35.5 billion	1.2 million	25-50% lower
Diabetes	$39.0 billion	7.3 million	90% lower
Gallbladder surgery	$3.2 billion	0.5 million	75% lower[10]

Cholesterol

Amount of cholesterol in a 3 oz. serving of: T-bone steak 72 mg; Chicken 75 mg; Turkey 76 mg; Salmon 74 mg; Shrimp 166 mg[11]

All foods derived from plants (fruits, vegetables, grains, legumes, nuts, seeds) 0 mg

Every time the blood cholesterol level rises one percent a corresponding risk of coronary heart disease rises two percent.[12]

A recent international conference of leading heart researchers concluded, "The optimal intake of cholesterol in the adult is probably zero."[13]

The Good News About Cholesterol

The human body makes all the cholesterol it needs. By changing their eating habits now, today's children can save themselves from elevated cholesterol and saturated fat levels that would have caused 1.5 million heart attacks and 500,000 needless premature deaths by 2030.[14]

Food Safety

Annually E. coli-tainted hamburger is the leading cause of at least 7,500 children contracting a severe disease, Hemolytic Uremic Syndrome.[17]

500 deaths and 20,000 illnesses are caused by E. coli every year.[18]

An estimated 325,000 Americans contract food-borne illnesses from eating fish each year.[19]

The food-borne illnesses in 1992 afflicted up to 7.13 million people and cost $6 billion. The majority of these come from animal products.[20][21][22]

Protein Requirements

The World Health Organization of the United Nations recommends only 4.5% of daily calories be provided as protein.[23]

The National Research Council says 8-10%.[24]

The average North American consumes four times the minimum daily requirement of protein and this leads to a host of overconsumption problems. Excess protein cannot be stored by the body and it must be broken down and excreted as waste material.

Animal Protein

Osteoporosis[25] and kidney disease[26] are linked to excess animal protein consumption.

Tens of millions of cases of osteoporosis[27] and kidney disease[28] exist in the United States.

Female meat eaters at age 65 experience an average measurable bone loss of 35%.[29]

The Good News About Vegetable Protein

Female vegetarians at age 65 experience an average measurable bone loss of 18%.[30]

Frances Moore Lappe, who popularized the concept of combining proteins, provided updated research that protein combining is unnecessary in a healthy, varied vegetarian diet.[31]

The Good News About Plant-Based Diets

A low-fat diet free of animal products can prevent, improve and/or cure: [32][33] Arthritis, Diverticulosis, Osteoporosis, Obesity, Diabetes, Impotence, Kidney Disease, Strokes, Hypoglycemia, Prostate Cancer, Salmonellosis, Constipation, Peptic Ulcers, Breast Cancer, Colon Cancer, High Blood Pressure, Asthma, Gallstones, Heart Disease, Trichinosis

Food Choices and the Planet

http://www.earthsave.org/environment.htm

The toll exacted on human health by a diet laden with saturated fat and cholesterol is devastating, and thoroughly documented. What is this same diet doing to our planet?

It takes 2,500 gallons of water, 12 pounds of grain, 35 pounds of topsoil and the energy equivalent of one gallon of gasoline to produce one pound of feedlot beef. Because of over-consumption of fish, all 17 of the world's major fishing areas have reached or exceeded their natural limits. One-third of the world's fish catch is fed directly to livestock.

Seventy percent of U.S. grain production is fed to livestock.

Five million acres of rainforest are felled every year in South and Central America alone to create cattle pasture.

Roughly 20% of all currently threatened and endangered species in the U.S. are harmed by livestock grazing.

Animal agriculture is a chief contributor to water pollution. America's farm animals pro-

duce 10 times the waste produced by the human population.

The Good News About the Environment and Our Food Choices

Many farmers are rediscovering the farming methods of their grandfathers and augmenting this with new knowledge of sustainable techniques. These are achieving the same or greater yields without the use of costly, harmful and soil-depleting petrochemical fertilizers and pesticides.

Ultimately, it is consumer demand that has brought us to this juncture of depleted and polluted soils, seas and freshwater supplies through the desire to have a "cheap" food supply. Only a profound change in consumer demand can prevent a total collapse of the seas and the soils.

By eating a varied plant-based diet, you can easily get all the nutrients you need to lead a healthy active life. Besides being easy, delicious, economical, fun and healthful, following a plant-based diet transforms your fork into a powerful tool for environmental protection and restoration.

Land Utilization and Soil Erosion

One-half of the Earth's land mass is grazed by livestock.[1]

More than 60% of the world's rangelands were damaged by overgrazing during the past half century.[2]

As much as 85% of rangeland in the western U.S. is being degraded by overgrazing.[3]

Overgrazing is by far the most pervasive cause of desertification.[4]

Thiry-five pounds of topsoil are lost in the production of one pound of grain-fed beef.[5]

Sixty-four percent of U.S. cropland produces livestock feed.[6]

Only 2% of U.S. cropland produces fruits and vegetables.[7]

Pounds of edible product that can be produced on an acre of prime land: Apples 20,000; Carrots 30,000; Potatoes 40,000; Tomatoes 50,000; Beef 250.[8]

Water Consumption

The number of gallons of water needed to produce one pound of edible product: Apples

49; Carrots 33; Potatoes 24; Tomatoes 23; Beef 2,500.[9,10]

Endangered Species

At least 100 animals are added to the endangered species list each year.[11]

Between 19 and 22 percent of all threatened and endangered species are harmed by livestock grazing.[12]

Rainforest Destruction

Five million acres of rainforest are felled every year in South and Central America to create cattle pasture.[13]

Cattle ranching has destroyed more Central American rainforest than any other activity.[14]

Seventy percent of cleared forests in Panama and Costa Rica are now in pasture.[15]

Pollution

Manure produced by all farm animals in the U.S. annually is roughly 10 times the waste produced by the human population.[16]

Factory farms are the biggest contributors to polluted rivers and streams in the US.[17]

At least 1,785 water bodies were impaired by feedlot pollution in 39 states in 1993.[18]

About 60,000 miles of streams in the U.S. have fisheries impaired by feedlot pollution.[19]

More soot is emitted from the grills in Los Angeles fast food restaurants than all the city buses.[20]

Pesticides & Food Contamination

Since 1945, when pesticides made from petrochemicals became popular, the following changes have occurred:[21,22,23]

Percentage Increase

Three thousand, three hundred percent overall pesticide use
Twenty percent overall crop losses due to insects
One hundred thousand percent pesticides applied per acre of corn

The drinking water in nearly every midwestern city south of Chicago is contaminated with agricultural weed killers.[24]

Meat, poultry and dairy products contain the major source of pesticide residues in the western diet.[25]

Ninety-five percent of human exposure to the potent carcinogen dioxin comes from consuming meat, poultry and dairy.[26]

The EPA issued more than 1,000 warnings against eating fish from chemically-contaminated waters in 1994.[27]

Nearly half of all fish sampled by Consumers Union was contaminated with bacterial from human or animal feces.[28]

Ninety-nine percent of U.S. non-vegetarian mother's milk has significant levels of DDT.[28]

Only eight percent of U.S. vegetarian mother's milk has significant levels of DDT.[29]

Resource Distribution

Resources used in the production of livestock:

33% of world's fish catch[30]

38% of the world's grain harvest{31]

50% of all the water used in the U.S.[32]

60% of Brazil's grain harvest[33]

70% of U.S. grain harvest[34]

80% of U.S. corn harvest[35]

Almost half of all energy expended in U.S. agriculture[36]

Fourteen percent of all cattle are fed back to cattle as part of protein-fortified feed[37]

Approximately 8 million pounds of poultry manure are fed annually to California's beef cattle.[38]

Fifty-five percent of all the antibiotics used in the U.S. are fed to animals, and 80% of

them are used to promote growth, not to treat disease.[39]

Twelve to sixteen pounds of grain and soy are needed to produce one pound of grain-fed beef.
[40]

All 17 of the worlds major fishing areas have reached or exceeded their natural limits due to overfishing.[41]

$3.7 billion subsidized animal feed grains in 1995. They are the U.S.'s most heavily subsidized crop.[42]

World Hunger

Five million children in the U.S. go hungry every month.[43]

Approximately 40,000 people die each day worldwide due to hunger or hunger-related causes.[44]

If Americans reduced their intake of meat by merely 10%, 100,000,000 people could be fed using the land, water and energy that would be freed up from growing livestock feed.[45]

Ten billion people could be sustained from present croplands if all ate a vegetarian diet.

The Facts

http://www.cowspiracy.com/facts

Greenhouse Gases

Animal agriculture is responsible for 18 percent of greenhouse gas emissions, more than the combined exhaust from all transportation.[1]

Transportation exhaust is responsible for 13 percent of all greenhouse gas emissions.[2]

Livestock and their byproducts account for at least 32,000 million tons of carbon dioxide (CO_2) per year, or 51 percent of all worldwide greenhouse gas emissions.[3]

Methane is 25 to 100 times more destructive than CO_2 on a 20-year time frame.[4]

Methane has a global warming potential 86 times that of CO_2 on a 20-year time frame.[5]

Livestock is responsible for 65 percent of all human-related emissions of nitrous oxide—a greenhouse gas with 296 times the global warming potential of carbon dioxide, and which stays in the atmosphere for 150 years.[6]

Emissions for agriculture are projected to increase 80 percent by 2050.[7]

Energy related emissions are expected to increase 20 percent by 2040.[8]

U.S. methane emissions from livestock and natural gas are nearly equal.[9]

Cows produce 150 billion gallons of methane per day.[10]

Converting to wind and solar power will take 20+ years and roughly 43 trillion dollars.[11]

Even without fossil fuels, we will exceed our 565 gigatons CO_2 equivalent limit by 2030, all from raising animals.[12]

Reducing methane emissions would create tangible benefits almost immediately. [13]

Water

Animal agriculture water consumption ranges from 34 to 76 trillion gallons annually. [14]

Agriculture is responsible for 80 to 90 percent of U.S. water consumption. [15]

Growing feed crops for livestock consumes 56 percent of water in the U.S. [16]

Californians use 1,500 gallons of water per person per day. Close to half of that is associated with meat and dairy products. [17]

Two thousand five hundred gallons of water are needed to produce one pound of beef.[18]

One thousand gallons of water are required to produce one gallon of milk.[19]

Five percent of water consumed in the U.S. is by private homes. Fifty-five percent of water consumed in the U.S. is for animal agriculture.[20]

Animal agriculture is responsible for 20 to 33 percent of all fresh water consumption in the world today.[21]

Land

Livestock or livestock feed occupies one-third of the Earth's ice-free land.[22]

Livestock covers 45 percent of the Earth's total land.[23]

Animal agriculture is the leading cause of species extinction, ocean dead zones, water pollution, and habitat destruction.[24]

Livestock operations on land have created more than 500 nitrogen flooded dead zones around the world in our oceans.[25]

We are in the midst of the largest mass extinction in 65 million years.[26]

Two to five acres of land are used per cow.[27]

Nearly half of the contiguous U.S. is devoted to animal agriculture.[28]

One-third of the planet is desertified, with livestock as the leading driver.[29]

Waste

Every minute, 7 million pounds of excrement are produced by animals raised for food in the U.S.[30]

A farm with 2,500 dairy cows produces the same amount of waste as a city of 411,000 people.[31]

One hundred and thirty times more animal waste than human waste is produced in the U.S.—1.4 billion tons from the meat industry annually. Five tons of animal waste is produced per person in the US.[32]

Oceans

Three-quarters of the world's fisheries are exploited or depleted.[33]

We could see fishless oceans by 2048.[34]

Ninety to one hundred million tons of fish are pulled from our oceans each year.[35]

As many as 2.7 trillion animals are pulled from the ocean each year.[36]

For every on pound of fish caught, up to five pounds of unintended marine species are caught and discarded as by-kill.[37]

As many as 40 percent (63 billion pounds) of fish caught globally every year are discarded.[38]

Scientists estimate as many as 650,000 whales, dolphins and seals are killed every year by fishing vessels.[39]

Fish catch peaks at 85 million tons.[40]

Forty to fifty million sharks are killed each year in fishing lines and nets.[41]

Rainforest

Animal agriculture is responsible for up to 91 percent of Amazon destruction.[42]

One to two acres of rainforest are cleared every second.[43]

The leading causes of rainforest destruction are livestock and feed crops.[44]

Up to 137 plant, animal and insect species are lost every day due to rainforest destruction.[45]

Twenty-six million rainforest acres (10.8 million hectares) have been cleared for palm oil production.[46]

One hundred and thirty-six million rainforest acres have been cleared for animal agriculture.[47]

One thousand and one hundred land activists have been killed in Brazil in the past 20 years.[48]

Ten thousand years ago, 99 percent of biomass (i.e. zoomass) was wild animals. Today, humans and the animals that we raise as food make up 98 percent of the zoomass.[49]

Humanity

World Population[50]

1812: 1 billion

1912: 1.5 billion

2012: 7 billion

2018: 7.6 billion

70 billion farmed animals are reared annually worldwide. More than 6 million animals are killed for food every hour.[51]

We are currently growing enough food to feed 10 billion people.[52]

Worldwide, at least 50 percent of grain is fed to livestock.[53]

Eighty-two percent of starving children live in countries where food is fed to animals, and the animals are eaten by Western countries.[54]

The average American consumes 209 pounds of meat per year.[55]

The world's population grows 228,000+ people every day.[56]

Land Required to Feed One Person for One Year[57]

Vegan: one-sixth of an acre

Vegetarian: three times as much as a vegan

Meat Eater: eighteen times as much as a vegan

One and one-half acres can produce 37,000 pounds of plant-based food. One and one-half acres can produce 375 pounds of beef.[58]

A person who eats a vegan diet produces the equivalent of 50 percent less carbon dioxide, uses 1/11th oil, 1/13th water, and 1/18th land compared to a meat-eater.59]

Each day, a person who eats a vegan diet saves 1,100 gallons of water, 45 pounds of grain, 30 square feet of forested land, 20 pounds CO2 equivalent, and one animal's life.[60]

About the Authors

David Klein, Ph.D., Naturorthopathic Doctor

A resident of Maui, Hawaii, Dr. David Klein is the Founder, Dean and Director of the online Vibrant Health & Wealth Academy. He is also the Director of the Colitis & Crohn's Health Recovery Center based on Maui, Hawaii. A Naturorthopathic Doctor with a Ph.D. in Natural Health & Healing, David received his degrees from the University of Natural Health. David also holds a Nutrition Educator certification from Bauman College as well as a B.S. in Civil Engineering with a concentration in Environmental Engineering from Northeastern University in Boston, Massachusetts. Originally from New Jersey where he decided to be an environmentalist at age 12, David worked eight years as a project engineer and manager in the field of environmental engineering in New Jersey, New York and California prior to beginning his career in the natural health field in 1992.

David has been a practitioner of the Fruitarian Lifestyle since 1984 when he healed a debilitating eight-year bout of severe ulcerative colitis. Adopting a vegan, fruit-based, alkalizing diet of mostly raw foods, adhering to food combining principles, and applying the natural, drugless self-healing protocol, he rapidly healed, rebuilt his depleted body and went on to establish a high level of vibrant health. He has thrived on a 100% raw food diet since 1993.

Since the late 1990s, David has been a leader in the raw food, Natural Hygiene, Raw Food, Vibrant Living and Self-Healing health spheres. In 1992 he founded the Colitis & Crohn's Health Recovery Center. His *Living Nutrition* and *Vibrance* magazines were the world's most widely read rawfood lifestyle periodical from 1996 to 2016. He has also authored and co-authored many books on the mind-body-spiritual aspects of natural health. His *Self Healing Colitis & Crohn's* guidebook is a world bestseller in its field, with

over 45,000 copies sold. Beginning in 2000 he produced over 20 Raw Passion Seminars and Jamborees across the USA and three Rawstock Festivals in northern California. In 2015 he founded the online Vibrant Health & Wealth Academy. In 2016, with Maui County's District Health Officer, Lorrin Pang, M.D., David co-founded the Physicians Coalition for Responsible Agriculture on Maui. In 2017, David became the vice president of the Hawaii Tropical Fruit Growers' Maui chapter.

As a Naturorthopathic Doctor and Self Healing Empowerment Coach, David has guided over 4,500 clients to vibrant wellness via the Vegan Healing Diet Plan he teaches. David is renown worldwide as a self-healing and vegan diet counselor master, as well as a stalwart leader in the field of wholistic health.

David is developing a Vibrant Living & Learning Center on Maui to be called Hua Nui, meaning "fruitful" in the Hawaiian language. It will stand as a premier institution of Vegan Regenerative Fruiticulture Living and serve as a bright beacon for wholistic health seekers and sustainable living enthusiasts worldwide.

Publications

These are available at https://vibranthealthandwealth.com.

A Look at Raw & Cooked Food Toxicity
Digestion Perfection with the Vegan Healing Diet Plan (with others)
Fasting & Eating for MInd-Body Purification (with others)
Fruiticulture (with Don Weaver and others)
Laws of Health A-Z
Living Nutrition Magazine (with others)
Raw 'n Delish Vibrant Recipes (with others)
Self Healing Colitis & Crohn's
Self Healing Power! (with others)
Somatic & Self Inquiries – Tools for Resolving Eating Disorders
Spiritual Nutrition (with others)
The Alkalizing Cleanse & The Alkalizing Diet
The Art of Rejuvenation
The Fruit Articles (with others)
The Fruits Of Healing – A Story About a Natural Healing of Ulcerative Colitis

The Health Education Imperative
The Vibrant Diet & Study Guide (with Dr. T. C. Fry, also in Spanish)

Don Weaver

After concluding an enjoyable dedication to competitive athletics, primarily basketball, Don Weaver has devoted the past 41 years as an ecologist, researcher, writer, and organic grower concerned with improving the health of humanity and the Biosphere. He has enjoyed those 41 years of relatively natural living and vibrant health on a 100% raw vegan diet, to test out the idea that a good gardener should be able to obtain all his/her nourishment from our "Once and Future" Garden of Eden without asking other animals to give up their lives. Don thinks the craze for raw "superfoods" is a natural desire for those seeking "superhealth," but reminds people through his talks and writings that if we'll first go to the small trouble (actually a big joy) of creating "super soil," then all our foods can and should be "superfoods," which with intelligent use can end the current global malnourishment of children and adults.

Don thinks that humanity must quickly emerge as the wisely generous species on Earth, if the growing momentum of eco-climatic and health degeneration is to be reversed. In 1978, he met the brilliant ecologist John D. Hamaker and learned how local and global soil remineralization with natural gravel (mixed rock) dust, to grow high-quality crops and trees, is a powerful and practical foundation for regenerating the socio-ecosphere and preventing catastrophic climate change of more than just a "warming" kind. John and Don subsequently collaborated to author *The Survival of Civilization*, produce 11 issues of *Solar Age or Ice Age? Bulletin*, plus write numerous articles for the magazines *Remineralize the Earth*, *Acres U.S.A.*, *Living Nutrition, Vibrance*, and others. Buckminster Fuller, considered by some the most brilliant mind of the 20th century, praised *The Survival of Civilization* as "well done, completely convincing." After John Hamaker passed away at age 80, Don spent five years researching and writing *To Love And Regenerate The Earth: Further Perspectives on The Survival of Civilizatio*n, which includes additional Hamaker writings in its 540 pages.

Don also assists the non-profit Remineralize the Earth (www.remineralize.org), and

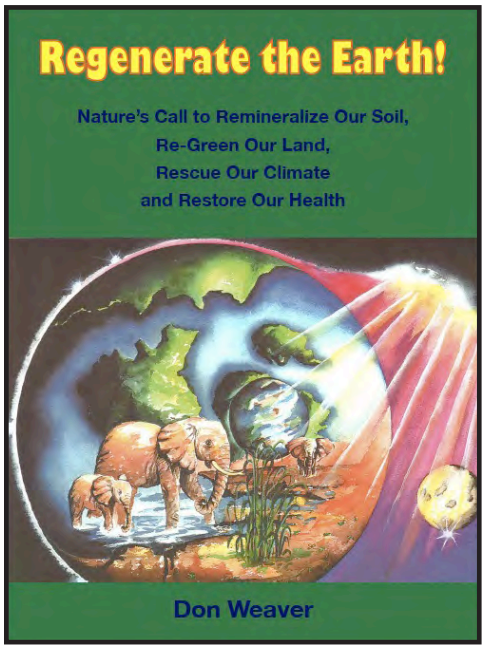

helps people start organic gardens, orchards and Earth Regeneration Centers. He lives and gardens in the San Francisco Bay Area and travels to speak at health and ecology conferences.

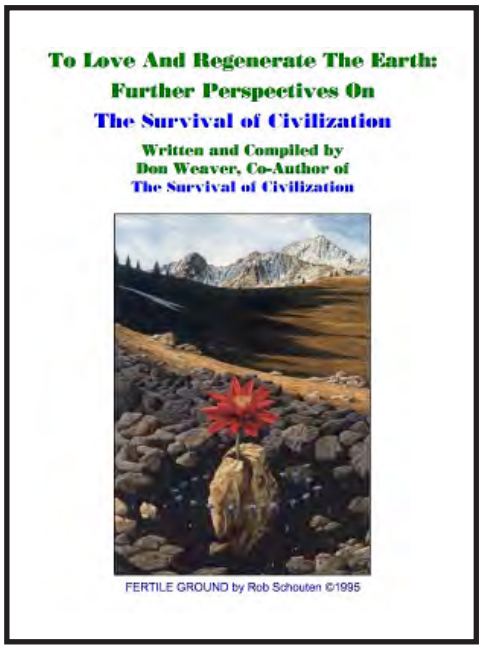

Contact Don via earthdon@yahoo.com, or POB 620478, Woodside CA 94062.
